

Anchor Fastening Technology Manual

09 / 2014

Foreword

Dear customer,

As it is our ambition to be the worldwide leader in fastening technology, we are continuously striving to provide you with state-of-the-art technical information reflecting the latest developments in codes, regulations and approvals and technical information for our products.

The Fastening Technology Manuals for Post-installed Anchors and for Anchor Channel reflect our ongoing investment into long term research and development of leading fastening products.

This Fastening Technology Manual for Post-installed Anchors should be a valuable support tool for you when solving fastening tasks with Post-installed Anchor fastening technology. It should provide you with profound technical know-how, and help you to be more productive in your daily work without any compromise regarding reliability and safety.

As we strive to be a reliable partner for you, we would very much appreciate your feedback for improvements. We are available at any time to answer additional questions that even go beyond this content.

Raimund Zaggl

Business Unit Anchors

Important notices

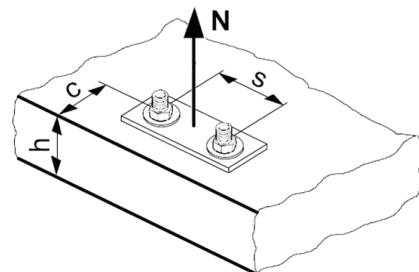

1. Construction materials and conditions vary on different sites. If it is suspected that the base material has insufficient strength to achieve a suitable fastening, contact the Hilti Technical Advisory Service.
2. The information and recommendations given herein are based on the principles, formulae and safety factors set out in the Hilti technical instructions, the operating manuals, the setting instructions, the installation manuals and other data sheets that are believed to be correct at the time of writing. The data and values are based on the respective average values obtained from tests under laboratory or other controlled conditions. It is the users responsibility to use the data given in the light of conditions on site and taking into account the intended use of the products concerned. The user has to check the listed prerequisites and criteria conform with the conditions actually existing on the job-site. Whilst Hilti can give general guidance and advice, the nature of Hilti products means that the ultimate responsibility for selecting the right product for a particular application must lie with the customer.
3. All products must be used, handled and applied strictly in accordance with all current instructions for use published by Hilti, i.e. technical instructions, operating manuals, setting instructions, installation manuals and others.
4. All products are supplied and advice is given subject to the Hilti terms of business.
5. Hilti's policy is one of continuous development. We therefore reserve the right to alter specifications, etc. without notice.
6. The given mean ultimate loads and characteristic data in the Anchor Fastening Technology Manual reflect actual test results and are thus valid only for the indicated test conditions. Due to variations in local base materials, on-site testing is required to determine performance at any specific site.
7. Hilti is not obligated for direct, indirect, incidental or consequential damages, losses or expenses in connection with, or by reason of, the use of, or inability to use the products for any purpose. Implied warranties of merchantability or fitness for a particular purpose are specifically excluded.

Technical data

The technical data presented in this Anchor Fastening Technology Manual are all based on numerous tests and evaluation according to the state-of-the art. Hilti anchors are tested in our test labs in Kaufering (Germany), Schaan (Liechtenstein) or Tulsa (USA) and evaluated by our experienced engineers and/or tested and evaluated by independent testing institutes in Europe and the USA.

Approval based data given in this manual are either according to **European Assessment Documents (EADs)** or **European Technical Approval Guidelines (ETAGs)** (that as of 1st of July 2013 are used as EADs or have been evaluated according to these guidelines and/or national regulations. Where national or international regulations do not cover all possible types of applications, additional Hilti data help to find customised solutions.

In addition to the standard tests for admissible service conditions and suitability tests (including seismic as an option), for safety relevant applications fire resistance, shock and fatigue tests may have been performed.

Basis for assessing anchors

European Technical Approval Guidelines have been developed prior to July 2013 for the assessment of products not covered by a harmonised standard.

The European Technical Approval Guideline **ETAG 001 „METAL ANCHORS FOR USE IN CONCRETE“** sets out the basis for assessing anchors to be used in concrete (cracked and non-cracked). It consists of:

- Part 1 Anchors in general
- Part 2 Torque-controlled expansion anchors
- Part 3 Undercut anchors
- Part 4 Deformation-controlled expansion anchors
- Part 5 Bonded anchors
- Part 6 Anchors for multiple use for non-structural applications
- Annex A Details of test
- Annex B Tests for admissible service conditions – detailed information
- Annex C Design methods for anchorages

For **special anchors** for use in concrete, additional Technical Reports (TR) related to ETAG 001 set out additional requirements for the assessment and/or provide a design method:

- **TR 018 Assessment of torque-controlled bonded anchors**
- **TR 020 Evaluation of Anchorages in Concrete concerning Resistance to Fire**
- **TR 029 Design of Bonded Anchors**

The European Technical Approval Guideline **ETAG 020 „PLASTIC ANCHORS FOR MULTIPLE USE IN CONCRETE AND MASONRY FOR NON-STRUCTURAL APPLICATIONS“** sets out the basis for assessing plastic anchors to be used in **concrete or masonry for redundant fastenings (multiple use)**. It consists of:

- Part 1 General
- Part 2 Plastic anchors for use in normal weight concrete
- Part 3 Plastic anchors for use in solid masonry materials
- Part 4 Plastic anchors for use in hollow or perforated masonry

- Part 5 Plastic anchors for use in autoclaved aerated concrete (AAC)
- Annex A Details of tests
- Annex B Recommendations for tests to be carried out on construction works
- Annex C Design methods for anchorages

The European Technical Approval Guidelines including related Technical Reports set out the requirements for anchors and the acceptance criteria they shall meet.

The general assessment approach adopted in the Guideline is based on combining relevant existing knowledge and experience of anchor behaviour with testing. Using this approach, testing is needed to assess the suitability of anchors.

The requirements in European Technical Approval Guidelines are set out in terms of objectives and of relevant actions to be taken into account. ETAGs specify values and characteristics, the conformity with which gives the presumption that the requirements set out are satisfied, whenever the state of art permits to do so. The Guidelines may indicate alternate possibilities for the demonstration of the satisfaction of the requirements.

Basis for assessing post-installed rebar connections

The basis for the assessment of **post-installed rebar connections** is set out in the following Technical Report:

- **TR 023 Assessment of post-installed rebar connections**

The Technical Report TR 023 covers post-installed rebar connections designed in accordance with EN 1992 - 1-1: 2004 (EC2) only. ETAG 001 (Part 1 and Part 5) is the general basis for the assessment of this application. The Technical Report TR 023 deals with the preconditions, assumptions and the required tests and assessments for post-installed rebars.

European Assessment Documents (from 1st of July 2013)

European Assessment Documents (EADs) are harmonised technical specifications, applicable as of 1st of July 2013 within the frame of the new Construction Products Regulation (EU/305/2011), developed by the European Organisation for Technical Assessment (EOTA).

The EADs contribute to the safe assessment of construction products, enables manufacturers to comply with European legislation, facilitates the uptake of innovation, research and technical development, and promotes the interoperability of products and sustainability. The EAD contains the following information:

- General information, scope and use of the products
- Essential characteristics of the products
- Method of assessment of the performance of the products
- Reference to the Assessment and Verification of Constancy of Performance (AVCP)
- Assumptions for the assessment of the performances
- Identification of the product
- Reference documents such as other EADs, standards, technical reports etc.
- Product related example for a Declaration of Performance (DoP)

As of 1st of July 2013 no new ETAGs will be developed. However, the **existing ETAGs can be used as EADs until they are transferred into new EADs**.

European Technical Assessment (previously European Technical Approval)

According to the new Construction Products Regulation (EU/305/2011), the European Technical Assessment (ETA) is a document that provides information on the assessment of the performance of product regarding its essential characteristics. An ETA is delivered by a Technical Assessment Body (TAB) upon request by a manufacturer and is the basis for a Declaration of Performance (DoP), which in turn is required for affixing the CE marking on the product.

Current ETAs issued after 1st of July 2013 are valid of indeterminate duration and contain the following information:

- General information on the manufacturer and the product type
- Description of the product and its intended use
- Performances of the product and references to the methods used for its assessment
- Assessment and Verification of Constancy of Performance systems (AVCP) applied
- Technical details necessary for the implementation of the AVCP

ETAs which were issued up to 30 June 2013, called European Technical Approvals and based on ETAGs, remain valid until the end of their validity period.

Declaration of performance (DoP)

The DoP is prepared by the manufacturer and presents the information about the performance of the product in relation to the essential characteristics. In drawing up the DoP, the manufacturer assumes the responsibility for the conformity of the construction product with the declared performance.

Assessment and Verification of Constancy of Performance (AVCP)

In order to ensure that the declaration of performance (DoP) for specific products is accurate and reliable, the performance of the construction products shall be assessed and their production in the factory shall be controlled to ensure that the products will continue to have the same performances.

This is achieved by applying a system of Assessment and Verification of Constancy of Performance (AVCP) for each family of construction product, for which several tasks have to be undertaken (e.g. for System 1+ and 1):

For the manufacturer:

- factory production control (permanent internal control of production and documentation according to a prescribed test plan)
- involve a body which is notified for the tasks

The notified product certification body decides on the issuing, restriction, suspension or withdrawal of the certificate of constancy of performance of the product on the basis of the outcome of the following assessments and verification carried out by the body:

- assessment of the performance of the product
- initial inspection of the manufacturing plant and of factory production control
- continuing surveillance, assessment and evaluation of factory production control

Base material

General

Different anchoring conditions

The wide variety of building materials used today provide different anchoring conditions for anchors. There is hardly a base material in or to which a fastening cannot be made with a Hilti product. However, the properties of the base material play a decisive role when selecting a suitable fastener / anchor and determining the load it can hold.

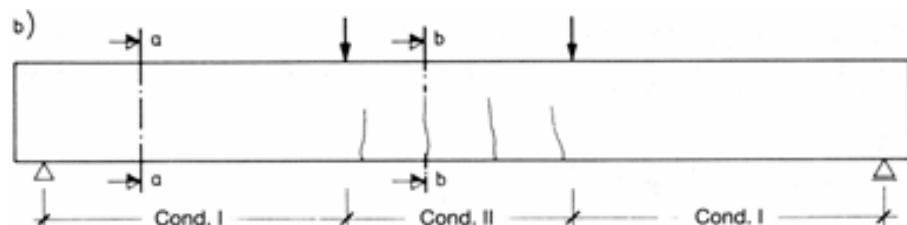

The main building materials suitable for anchor fastenings have been described in the following.

Concrete

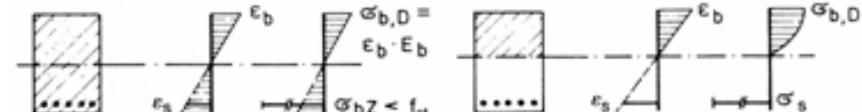

A mixture of cement, aggregates and water

Concrete is synthetic stone, consisting of a mixture of cement, aggregates and water, possibly also additives, which is produced when the cement paste hardens and cures. Concrete has a relatively high compressive strength, but only low tensile strength. Steel reinforcing bars are cast in concrete to take up tensile forces. It is then referred to as reinforced concrete.

Cracking from bending

Stress and strain in sections with conditions I and II

$\sigma_{b,D}$ calculated compressive stress

$\sigma_{b,Z}$ calculated tensile stress

f_{ct} concrete tensile strength

If cracks in the tension zone exist, suitable anchor systems are required

If the tensile strength of concrete is exceeded, cracks form, which, as a rule, cannot be seen. Experience has shown that the crack width does not exceed the figure regarded as admissible, i.e. $w \leq 0.3\text{mm}$, if the concrete is under a constant load. If it is subjected predominately to forces of constraint, individual cracks might be wider if no additional reinforcement is provided in the concrete to restrict the crack width. If a concrete component is subjected to a bending load, the cracks have a wedge shape across the component cross-section and they end close to the neutral axis. It is recommended that anchors that are suitable in cracked concrete be used in the tension zone of concrete components. Other types of anchors can be used if they are set in the compression zone.

Observe curing of concrete when using expansion anchors

Anchors are set in both low-strength and high-strength concrete. Generally, the range of the cube compressive strength, $f_{ck,cube,150}$, is between 25 and 60 N/mm². Expansion anchors should not be set in concrete which has not cured for more than seven days. If anchors are loaded immediately after they have been set, the loading capacity can be assumed to be only the actual strength of the concrete at that time. If an anchor is set and the load applied later, the loading capacity can be assumed to be the concrete strength determined at the time of applying the load.

Cutting through reinforcement when drilling anchor holes must be avoided. If this is not possible, the design engineer responsible must be consulted first.

Avoid cutting reinforcement

Masonry

Masonry is a heterogeneous base material. The hole being drilled for an anchor can run into mortar joints or cavities. Owing to the relatively low strength of masonry, the loads taken up locally cannot be particularly high. A tremendous variety of types and shapes of masonry bricks are on the market, e.g. clay bricks, sand-lime bricks or concrete bricks, all of different shapes and either solid or with cavities. Hilti offers a range of different fastening solutions for this variety of masonry base material, e.g. the HPS-1, HRD, HUD, HIT, etc.

If there are doubts when selecting a fastener / anchor, your local Hilti sales representative will be pleased to provide assistance.

When making a fastening, care must be taken to ensure that a layer of insulation or plaster is not used as the base material. The specified anchorage depth (depth of embedment) must be in the actual base material.

Different types and shapes

Other base materials

Aerated concrete: This is manufactured from fine-grained sand as the aggregate, lime and/or cement as the binding agent, water and aluminium as the gas-forming agent. The density is between 0.4 and 0.8 kg/dm³ and the compressive strength 2 to 6 N/mm². Hilti offers the HGN and HRD-U anchors for this base material.

Aerated concrete

Lightweight concrete: This is concrete which has a low density, i.e. ≤ 1800 kg/m³, and a porosity that reduces the strength of the concrete and thus the loading capacity of an anchor. Hilti offers the HRD, HUD, HGN, etc anchor systems for this base material.

Lightweight concrete

Drywall (plasterboard/gypsum) panels: These are mostly building components without a supporting function, such as wall and ceiling panels, to which less important, so-called secondary fastenings are made. The Hilti anchors suitable for this material are the HTB, HLD and HHD.

Drywall / gypsum panels

In addition to the previously named building materials, a large variety of others, e.g. natural stone, etc, can be encountered in practice. Furthermore, special building components are also made from the previously mentioned materials which, because of manufacturing method and configuration, result in base materials with peculiarities that must be given careful attention, e.g. hollow ceiling floor components, etc.

Variety of base materials

Descriptions and explanations of each of these would go beyond the bounds of this manual. Generally though, fastenings can be made to these materials. In some cases, test reports exist for these special materials. It is also recommended that the design engineer, company carrying out the work and Hilti technical staff hold a discussion in each case.

In some cases, testing on the jobsite should be arranged to verify the suitability and the loading capacity of the selected anchor.

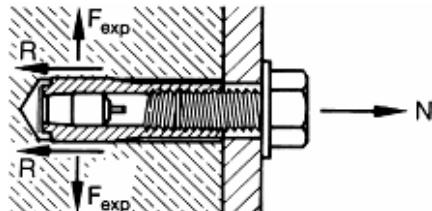

Jobsite tests

Why does an anchor hold in a base material?

Working principles

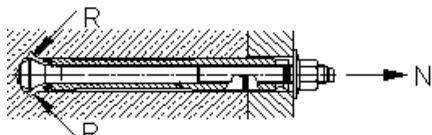

There are three basic working principles which make an anchor hold in a building material:

Friction

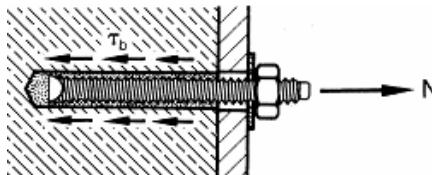

The tensile load, N , is transferred to the base material by friction, R . The expansion force, F_{exp} , is necessary for this to take place. It is produced, for example, by driving in an expansion plug (HKD).

Keying

The tensile load, N , is in equilibrium with the supporting forces, R , acting on the base material, such as with the HDA anchor.

Bonding

An adhesive bond is produced between the anchor rod and the hole wall by a synthetic resin adhesive, such as with HVU with HAS anchor rods.

Combination of working principles

Many anchors obtain their holding power from a combination of the above mentioned working principles.

Force-controlled and displacement-controlled expansion anchors

For example, an anchor exerts an expansion force against wall of its hole as a result of the displacement of a cone relative to a sleeve. This permits the longitudinal force to be transferred to the anchor by friction. At the same time, this expansion force causes permanent local deformation of the base material, above all in the case of metal anchors. A keying action results which enables the longitudinal force in the anchor to be transferred additionally to the base material.

In the case of expansion anchors, a distinction is made between force-controlled and movement-controlled types. The expansion force of force-controlled expansion anchors is dependent on the tensile force in the anchor (HSL-3 heavy-duty anchor). This tensile force is produced, and thus controlled, when a tightening torque is applied to expand the anchor.

In the case of movement-controlled types, expansion takes place over a distance that is predetermined by the geometry of the anchor in the expanded state. Thus an expansion force is produced (HKD anchor) which is governed by the modulus of elasticity of the base material.

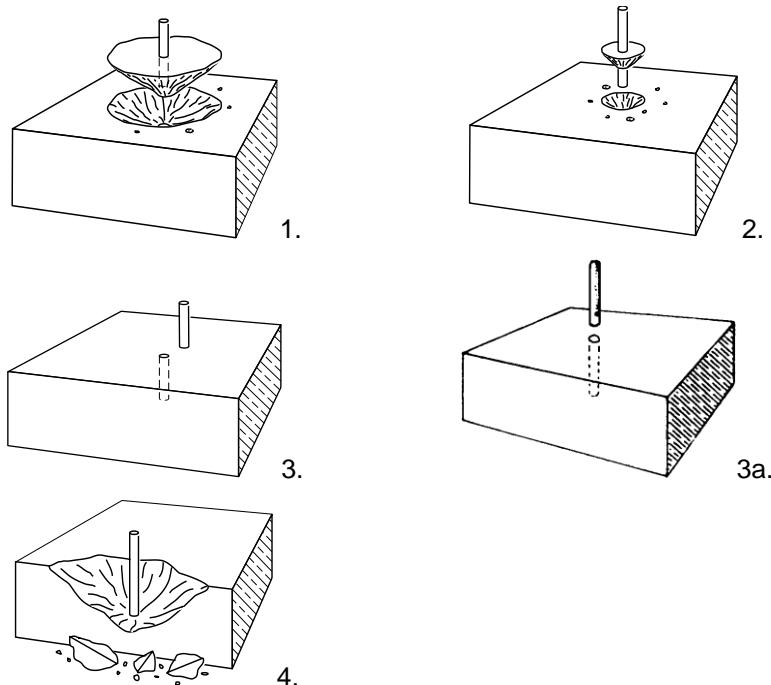

Adhesive/resin anchor

The synthetic resin of an adhesive anchor infiltrates into the pores of the base material and, after it has hardened and cured, achieves a local keying action in addition to the bond.

Failure modes

Effects of static loading

The failure patterns of anchor fastenings subjected to a continually increased load can be depicted as follows:

The weakest point in an anchor fastening determines the cause of failure. Modes of failure, 1. break-out, 2. anchor pull-away and, 3., 3a., failure of anchor parts, occur mostly when single anchors that are a suitable distance from an edge or the next anchor, are subjected to a pure tensile load. These causes of failure govern the max. loading capacity of anchors. On the other hand, a small edge distance causes mode of failure 4. edge breaking. The ultimate loads are then smaller than those of the previously mentioned modes of failure. The tensile strength of the fastening base material is exceeded in the cases of break-out, edge breaking and splitting.

Basically, the same modes of failure take place under a combined load. The mode of failure 1. break-out, becomes more seldom as the angle between the direction of the applied load and the anchor axis increases.

Generally, a shear load causes a conchoidal (shell-like) area of spall on one side of the anchor hole and, subsequently, the anchor parts suffer bending tension or shear failure. If the distance from an edge is small and the shear load is towards the free edge of a building component, however, the edge breaks away.

Causes of failure

Combined load

Shear load

Influence of cracks

Very narrow cracks are not defects in a structure

It is not possible for a reinforced concrete structure to be built which does not have cracks in it under working conditions. Provided that they do not exceed a certain width, however, it is not at all necessary to regard cracks as defects in a structure. With this in mind, the designer of a structure assumes that cracks will exist in the tension zone of reinforced concrete components when carrying out the design work (condition II). Tensile forces from bending are taken up in a composite construction by suitably sized reinforcement in the form of ribbed steel bars, whereas the compressive forces from bending are taken up by the concrete (compression zone).

Efficient utilisation of reinforcement

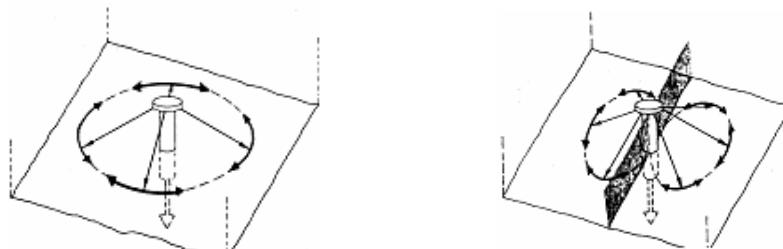

The reinforcement is only utilised efficiently if the concrete in the tension zone is permitted to be stressed (elongated) to such an extent that it cracks under the working load. The position of the tension zone is determined by the static / design system and where the load is applied to the structure. Normally, the cracks run in one direction (line or parallel cracks). Only in rare cases, such as with reinforced concrete slabs stressed in two planes, can cracks also run in two directions.

Testing and application conditions for anchors are currently being drafted internationally based on the research results of anchor manufacturers and universities. These will guarantee the functional reliability and safety of anchor fastenings made in cracked concrete.

Loadbearing mechanisms

When anchor fastenings are made in non-cracked concrete, equilibrium is established by a tensile stress condition of rotational symmetry around the anchor axis. If a crack exists, the loadbearing mechanisms are seriously disrupted because virtually no annular tensile forces can be taken up beyond the edge of the crack. The disruption caused by the crack reduces the loadbearing capacity of the anchor system.

Crack plane

a) Non-cracked concrete

b) Cracked concrete

Reduction factor for cracked concrete

The width of a crack in a concrete component has a major influence on the tensile loading capacity of all fasteners, not only anchors, but also cast-in items, such as headed studs. A crack width of about 0.3mm is assumed when designing anchor fastenings. The reduction factor which can be used for the ultimate tensile loads of anchor fastenings made in cracked concrete as opposed to non-cracked concrete may be assumed to be 0.65 to 0.70 for the HSC anchor, for example. Larger reduction factors for ultimate tensile loads must be anticipated (used in calculations) in the case of all those anchors which were set in the past without any consideration of the above-mentioned influence of cracks. In this respect, the safety factor to use to allow for the failure of cracked concrete is not the same as the figure given in product information, i.e. all previous figures in the old anchor manual. This is an unacceptable situation which is being eliminated through specific testing with anchors set in cracked concrete, and adding suitable information to the product description sheets.

Since international testing conditions for anchors are based on the above-mentioned crack widths, no theoretical relationship between ultimate tensile loads and different crack widths has been given.

The statements made above apply primarily to static loading conditions. If the loading is dynamic, the clamping force and pretensioning force in an anchor bolt / rod play a major role. If a crack propagates in a reinforced concrete component after an anchor has been set, it must be assumed that the pretensioning force in the anchor will decrease and, as a result, the clamping force from the fixture (part fastened) will be reduced (lost). The properties of this fastening for dynamic loading will then have deteriorated. To ensure that an anchor fastening remains suitable for dynamic loading even after cracks appear in the concrete, the clamping force and pretensioning force in the anchor must be upheld. Suitable measures to achieve this can be sets of springs or similar devices.

As a structure responds to earthquake ground motion it experiences displacement and consequently deformation of its individual members. This deformation leads to the formation and opening of cracks in members. Consequently all anchorages intended to transfer earthquake loads should be suitable for use in cracked concrete and their design should be predicted on the assumption that cracks in the concrete will cycle open and closed for the duration of the ground motion.

Parts of the structures may be subjected to extreme inelastic deformation. In the reinforced areas yielding of the reinforcement and cycling of cracks may result in cracks width of several millimetres, particularly in regions of plastic hinges. Qualification procedures for anchors do not currently anticipate such large crack widths. For this reason, anchorages in this region where plastic hinging is expected to occur, such as the base of shear wall and joint regions of frames, should be avoided unless apposite design measures are taken.

Pretensioning force in anchor bolts / rods

Loss of pretensioning force due to cracks

Seismic loads and cracked concrete

Anchor design

Safety concept

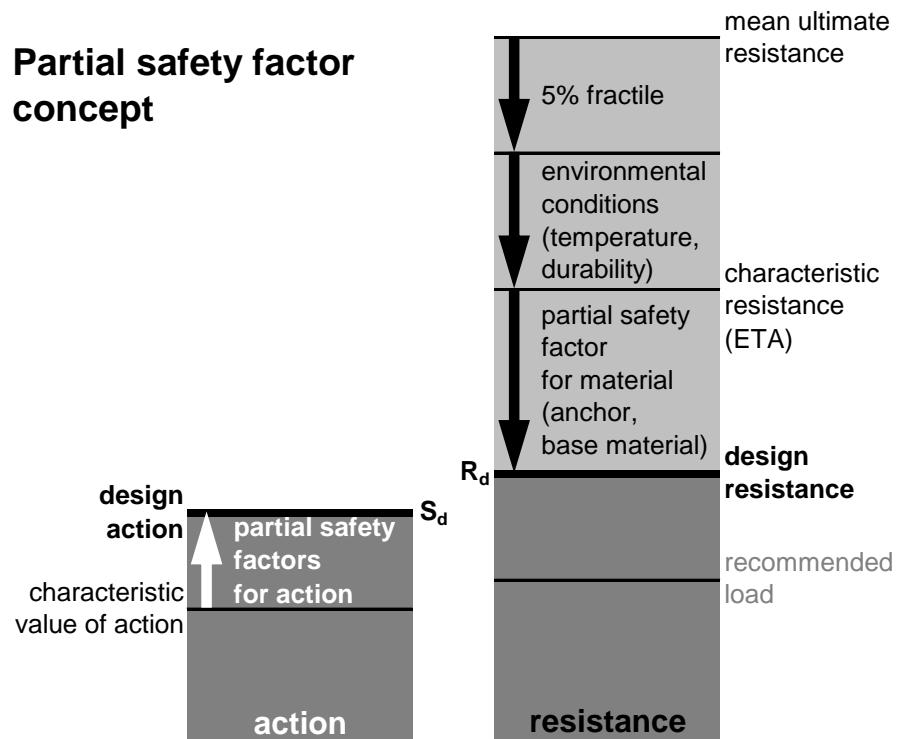

Depending on the application and the anchor type one of the following two concepts can be applied:

For anchors for use in concrete having an European Technical Approval (ETA) the partial safety factor concept according to the European Technical Approval Guidelines ETAG 001 or ETAG 020 shall be applied. It has to be shown, that the value of design actions does not exceed the value of the design resistance: $S_d \leq R_d$.

For the characteristic resistance given in the respective ETA, reduction factors due to e.g. freeze/thaw, service temperature, durability, creep behaviour and other environmental or application conditions are already considered.

In addition to the design resistance, in this manual recommended loads are given, using an overall partial safety factor for action $\gamma = 1,4$.

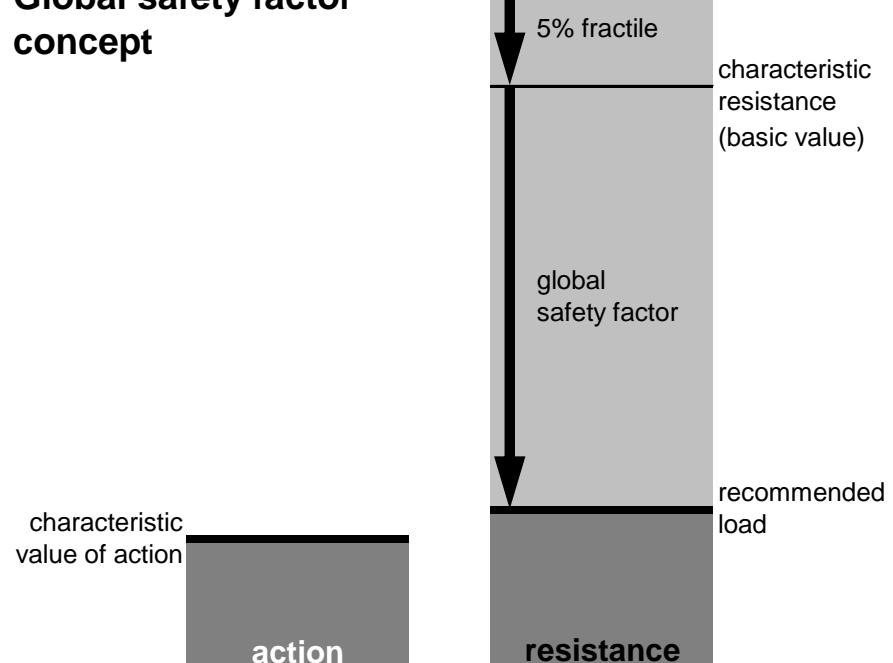

Partial safety factor concept

Global safety factor concept

For the global safety factor concept it has to be shown, that the characteristic value of action does not exceed the recommend load value.

The characteristic resistance given in the tables is the 5% fractile value obtained from test results under standard test conditions. With a global safety factor all environmental and application conditions for action and resistance are considered, leading to a recommended load.

Design methods

Metal anchors for use in concrete according ETAG 001

The design methods for metal anchors for use in concrete are described in detail in Annex C of the European Technical Approval guideline ETAG 001 and for bonded anchors with variable embedment depth in EOTA Technical Report TR 029. Additional design rules for redundant fastenings are given in Part 6 of ETAG 001.

The design method given in this Anchor Fastening Technology Manual is based on these guidelines. The calculations according to this manual are simplified and lead to conservative results, i.e. the results are on the safe side. Tables with basic load values and influencing factors and the calculation method are given for each anchor in the respective section.

Anchors for use in other base materials and for special applications

If no special calculation method is given, the basic load values given in this manual are valid, as long as the application conditions (e.g. base material, geometry, environmental conditions) are observed.

Redundant fastenings with plastic anchors

Design rules for redundant fastenings with plastic anchors for use in concrete and masonry for non-structural applications are given in Annex C of ETAG 020. The additional design rules for redundant fastenings are considered in this manual.

Resistance to fire

When resistance to fire has to be considered, the load values given in the section "resistance to fire" should be observed. The values are valid for a single anchor.

Hilti design software PROFIS Anchor

For a more complex and accurate design according to international and national guidelines and for applications beyond the guidelines, e.g. group of anchors with more than four anchors close to the edge or more than eight anchors far away from the edge, the Hilti design software PROFIS Anchor yields customised fastening solutions. The results can be different from the calculations according to this manual.

The following methods can be used for design using PROFIS Anchor:

- ETAG
- CEN/TS
- ACI 318-08
- CSA (Canadian standard)
- Solution for Fastening (Hilti internal design method)

Simplified design method

Simplified version of the design method A according ETAG 001, Annex C or EOTA Technical Report TR 029. Design resistance according data given in the relevant European Technical Approval (ETA)

- Influence of concrete strength
- Influence of edge distance
- Influence of spacing
- Valid for a group of two anchors. (The method may also be applied for anchor groups with more than two anchors or more than one edge. The influencing factors must then be considered for each edge distance and spacing. The calculated design loads are then on the safe side: They will be lower than the exact values according ETAG 001, Annex C. To avoid this, it is recommended to use the anchor design software PROFIS anchor)

The design method is based on the following simplification:

- No different loads are acting on individual anchors (no eccentricity)

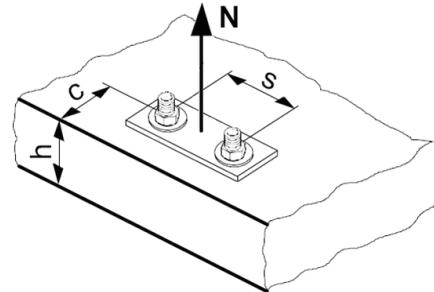

The differences to the design method given in the guideline are shown in the following.

Annex C of ETAG 001 and EOTA TR 029 compared to simplified design

Design tensile resistance

The design tensile resistance is the lower value of

- Design steel resistance $N_{Rd,s}$
- Design pull-out resistance $N_{Rd,p}$
(Design combined pull-out and concrete cone resistance for bonded anchors)
- Design concrete cone resistance $N_{Rd,c}$
- Design splitting resistance $N_{Rd,sp}$

Design steel resistance $N_{Rd,s}$

Annex C of ETAG 001 / EOTA TR 029 and relevant ETA

$$N_{Rd,s} = N_{Rk,s} / \gamma_{Ms}$$

* $N_{Rk,s}$: characteristic steel resistance
* γ_{Ms} : partial safety factor for steel failure
* Values given in the relevant ETA

Simplified design method

$$** N_{Rd,s}$$

** Value given in the respective tables in this manual

Design pull-out resistance $N_{Rd,p}$ for anchors designed according Annex C of ETAG 001

Annex C of ETAG 001 and relevant ETA

$$N_{Rd,p} = (N_{Rk,p} / \gamma_{Mp}) \cdot \psi_c$$

* $N_{Rk,p}$: characteristic pull-out resistance
* γ_{Mp} : partial safety factor for pull-out failure
* ψ_c : influence of concrete strength
* Values given in the relevant ETA

Simplified design method

$$N_{Rd,p} = N_{Rd,p}^0 \cdot f_B$$

** $N_{Rd,p}^0$: Basic design pull-out resistance

** f_B : influence of concrete strength

** Values given in the respective tables in this manual

Design combined pull-out and concrete cone resistance $N_{Rd,p}$ for bonded anchors designed according EOTA TR 029
**EOTA TR 029
and relevant ETA**

$$N_{Rd,p} = (N_{Rk,p}^0 / \gamma_{Mp}) \cdot (A_{p,N} / A_{p,N}^0) \cdot \psi_{s,Np} \cdot \psi_{g,Np} \cdot \psi_{ec,Np} \cdot \psi_{re,Np} \cdot \psi_c$$

where $N_{Rk,p}^0 = \pi \cdot d \cdot h_{ef} \cdot \tau_{Rk}$

$$\psi_{g,Np} = \psi_{g,Np}^0 - (s / s_{cr,Np})^{0.5} \cdot (\psi_{g,Np}^0 - 1) \geq 1$$

$$\psi_{g,Np}^0 = n^{0.5} - (n^{0.5} - 1) \cdot \{(d \cdot \tau_{Rk}) / [k \cdot (h_{ef} \cdot f_{ck,cube})^{0.5}] \}^{1.5} \geq 1$$

$$s_{cr,Np} = 20 \cdot d \cdot (\tau_{Rk,ucr} / 7.5)^{0.5} \leq 3 \cdot h_{ef}$$

* γ_{Mp} : partial safety factor for combined pull-out and concrete cone failure

+ $A_{p,N}^0$: influence area of an individual anchor with large spacing and edge distance at the concrete surface (idealised)

+ $A_{p,N}$: actual influence area of the anchorage at the concrete surface, limited by overlapping areas of adjoining anchors and by edges of the concrete member

+ $\psi_{s,Np}$: influence of the disturbance of the distribution of stresses due to edges

+ $\psi_{ec,Np}$: influence of eccentricity

+ $\psi_{re,Np}$: influence of dense reinforcement

* ψ_c : influence of concrete strength

* d : anchor diameter

* h_{ef} : (variable) embedment depth

* τ_{Rk} : characteristic bond resistance

s : anchor spacing

$s_{cr,Np}$: critical anchor spacing

n : number of anchors in a anchor group

k : = 2,3 in cracked concrete
= 3,2 in non-cracked concrete

$f_{ck,cube}$: concrete compressive strength

* $\tau_{Rk,ucr}$: characteristic bond resistance for non-cracked concrete

* Values given in the relevant ETA

+ Values have to be calculated according data given in the relevant ETA (details of calculation see TR 029. The basis of the calculations may depend on the critical anchor spacing).

Simplified design method

$$N_{Rd,p} = N_{Rd,p}^0 \cdot f_{B,p} \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,p} \cdot f_{re,N}$$

** $N_{Rd,p}^0$: Basic design combined pull-out and concrete cone resistance

** $f_{B,p}$: influence of concrete strength

** $f_{1,N}, f_{2,N}$: influence of edge distance

** $f_{3,N}$: influence of anchor spacing

** $f_{h,p}$: influence of (variable) embedment depth

** $f_{re,N}$: influence of dense reinforcement

** Values given in the respective tables in this manual

For the simplified design method the factor $\psi_{g,Np}$ (see TR 029) is assumed to be 1 and the critical anchor spacing is assumed to be $s_{cr,Np} = 3 \cdot h_{ef}$, both leading to conservative results = being on the safe side.

Design concrete cone resistance $N_{Rd,c}$ **Annex C of ETAG 001 / EOTA TR 029
and relevant ETA**

$N_{Rd,c} = (N_{Rk,c}^0 / \gamma_{Mc}) \cdot (A_{c,N} / A_{c,N}^0) \cdot \psi_{s,N} \cdot \psi_{re,N} \cdot \psi_{ec,N}$	Simplified design method
where $N_{Rk,c}^0 = k_1 \cdot f_{ck,cube}^{0,5} \cdot h_{ef}^{1,5}$	$N_{Rd,c} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,N} \cdot f_{re,N}$
* γ_{Mc} : partial safety factor for concrete cone failure	** $N_{Rd,c}^0$: Basic design concrete cone resistance

	** $f_{1,N}, f_{2,N}$: influence of edge distance
	** $f_{3,N}$: influence of anchor spacing
+ $A_{c,N}$: actual area of concrete cone of the anchorage at the concrete surface, limited by overlapping concrete cones of adjoining anchors	** $f_{h,N}$: influence of embedment depth
	** $f_{re,N}$: influence of dense reinforcement
edges	** Values given in the respective tables in this manual
+ $\psi_{s,N}$: influence of the disturbance of the distribution of stresses due to edges	
+ $\psi_{re,N}$: influence of dense reinforcement	
+ $\psi_{ec,N}$: influence of eccentricity	
k_1 :	
= 7,2 for anchorages in cracked concrete	
= 10,1 for anchorages in non-cracked concrete	
$f_{ck,cube}$: concrete compressive strength	
* h_{ef} : effective anchorage depth	

* Values given in the relevant ETA

+ Values have to be calculated according data given in the relevant ETA (details of calculation see Annex C of ETAG 001 or EOTA TR 029)

Design concrete splitting resistance $N_{Rd,sp}$

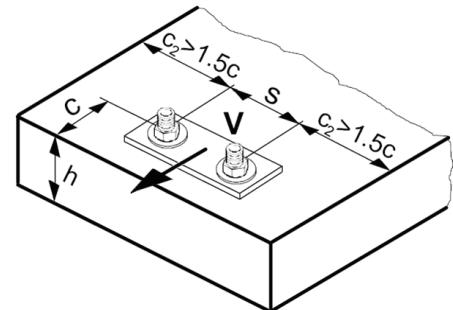

Annex C of ETAG 001 / EOTA TR 029 and relevant ETA

$N_{Rd,sp} = (N_{Rk,c}^0 / \gamma_{Mc}) \cdot (A_{c,N} / A_{c,N}^0) \cdot \psi_{s,N} \cdot \psi_{re,N} \cdot \psi_{ec,N} \cdot \psi_{h,sp}$	Simplified design method
where $N_{Rk,c}^0 = k_1 \cdot f_{ck,cube}^{0,5} \cdot h_{ef}^{1,5}$	$N_{Rd,sp} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,N} \cdot f_{re,N}$
* γ_{Mc} : partial safety factor for concrete cone failure	** $N_{Rd,c}^0$: Basic design concrete cone resistance
++ $A_{c,N}^0$: area of concrete cone of an individual anchor with large spacing	** f_B : influence of concrete strength
	** $f_{1,sp}, f_{2,sp}$: influence of edge distance
	** $f_{3,sp}$: influence of anchor spacing
	** $f_{h,N}$: influence of base material thickness (concrete member depth)
	** $f_{re,N}$: influence of dense reinforcement
anchors and by edges of the concrete member	** Values given in the respective tables in this manual
+ $\psi_{s,N}$: influence of the disturbance of the distribution of stresses due to edges	
+ $\psi_{re,N}$: influence of dense reinforcement	
+ $\psi_{ec,N}$: influence of eccentricity	
k_1 :	
= 7,2 for anchorages in cracked concrete	
= 10,1 for anchorages in non-cracked concrete	
+ $\psi_{h,sp}$: influence of the actual member depth	
$f_{ck,cube}$: concrete compressive strength	
* h_{ef} : embedment depth	
* Values given in the relevant ETA	
+ Values have to be calculated according data given in the relevant ETA (details of calculation see Annex C of ETAG 001 or EOTA TR 029)	
++ Values of $A_{c,N}^0$ and $A_{c,N}$ for splitting failure may be different from those for concrete cone failure, due to different values for the critical edge distance and critical anchor spacing	

Design shear resistance

The design shear resistance is the lower value of

- Design steel resistance $V_{Rd,s}$
- Design concrete prout resistance $V_{Rd,cp}$
- Design concrete edge resistance $V_{Rd,c}$

**Design steel resistance $V_{Rd,s}$ (without lever arm)**

Annex C of ETAG 001 / EOTA TR 029 and relevant ETA

$$V_{Rd,s} = V_{Rk,s} / \gamma_{Ms}$$

* $V_{Rk,s}$: characteristic steel resistance

* γ_{Ms} : partial safety factor for steel failure

* Values given in the relevant ETA

For steel failure with lever arm see Annex C of ETAG 001 or EOTA TR 029

Simplified design method

$$** V_{Rd,s}$$

** Value given in the respective tables in this manual
Steel failure with lever arm is not considered for the simplified design method

EOTA TR 029 and relevant ETA

$V_{Rd,cp} = (V_{Rk,cp} / \gamma_{Mp/Mc}) = k \cdot \text{lower value of } N_{Rd,p} \text{ and } N_{Rd,c}$	Simplified design method
$N_{Rd,p} = N_{Rk,p} / \gamma_{Mp}$	$V_{Rd,cp} = k \cdot \text{lower value of } N_{Rd,p} \text{ and } N_{Rd,c}$
$N_{Rd,c} = N_{Rk,c} / \gamma_{Mc}$	$N_{Rd,p}$: characteristic tension resistance for combined pull-out and concrete cone failure (see design combined pull-out and concrete cone failure)
$N_{Rd,p}$: characteristic tension resistance for combined pull-out and concrete cone failure (see design combined pull-out and concrete cone failure)	$N_{Rk,c}$: characteristic tension resistance for concrete cone failure (see design concrete cone failure)
$N_{Rk,c}$: characteristic tension resistance for concrete cone failure (see design concrete cone failure)	** k : influence of embedment depth
* γ_{Mp} : partial safety factor for combined pull-out and concrete cone failure (see design combined pull-out and concrete cone failure)	** Values given in the respective tables in this manual
* γ_{Mc} : partial safety factor for concrete cone failure (see design concrete cone failure)	
* k : influence of embedment depth	

* Values given in the relevant ETA

Design concrete edge resistance $V_{Rd,c}$ **Annex C of ETAG 001 / EOTA TR 029
and relevant ETA**

$$V_{Rd,c} = (V_{Rk,c}^0 / \gamma_{Mc}) \cdot (A_{c,v} / A_{c,v}^0) \cdot \psi_{s,v} \cdot \psi_{h,v} \cdot \psi_{\alpha,v} \cdot \psi_{ec,v} \cdot \psi_{re,v}$$

where $V_{Rk,c}^0 = k_1 \cdot d^\alpha \cdot h_{ef}^\beta \cdot f_{ck,cube}^{0,5} \cdot c_1^{1,5}$

$$\alpha = 0,1 \cdot (h_{ef} / c_1)^{0,5}$$

$$\beta = 0,1 \cdot (d / c_1)^{0,2}$$

* γ_{Mc} : partial safety factor for concrete edge failure

+ $A_{c,v}^0$: area of concrete cone of an individual anchor at the lateral concrete surface not affected by edges (idealised)

+ $A_{c,v}$: actual area of concrete cone of anchorage at the lateral concrete surface, limited by overlapping concrete cones of adjoining anchors,

by edges of the concrete member and by member thickness

+ $\psi_{s,v}$: influence of the disturbance of the distribution of stresses due to further edges

+ $\psi_{h,v}$: takes account of the fact that the shear resistance does not decrease proportionally to the membrane thickness

as assumed by the idealised ratio $A_{c,v} / A_{c,v}^0$

++ $\psi_{\alpha,v}$: Influence of angle between load applied and the direction perpendicular to the free edge

++ $\psi_{ec,v}$: influence of eccentricity

++ $\psi_{re,v}$: influence of reinforcement

k_1 : = 1,7 for anchorages in cracked concrete
= 2,4 for anchorages in non-cracked concrete

* d : anchor diameter

$f_{ck,cube}$: concrete compressive strength
 c_1 : edge distance

* Values given in the relevant ETA

+ Values have to be calculated according data given in the relevant ETA (details of calculation see Annex C of ETAG 001 or EOTA TR 029)

++ Details see Annex C of ETAG 001 or EOTA TR 029

Simplified design method

$$V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_\beta \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$$

** $V_{Rd,c}^0$: Basic design concrete edge resistance

** f_B : influence of concrete strength

** f_β : Influence of angle between load applied and the direction perpendicular to the free edge

** f_h : Influence of base material thickness

** f_4 : Influence of anchor spacing and edge distance

** f_{hef} : influence of embedment depth

** f_c : influence of edge distance

** Values given in the respective tables in this manual

The factors f_{hef} and f_c replace the function $d^\alpha \cdot h_{ef}^\beta$, leading to conservative results = being on the safe side.

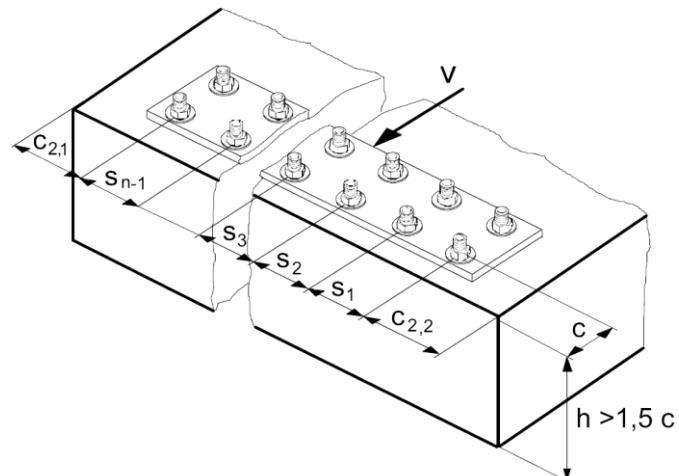

Special case: more than 2 anchors close to an edge

For a group of anchors f_4 can be calculated according to the following equation, if all anchors are equally loaded. This can be achieved by filling the annular gaps with a high performance injection mortar (e.g. Hilti HIT-RE 500-SD or Hilti HIT-HY 150 MAX).

$$f_4 = \left(\frac{c}{h_{ef}} \right)^{1,5} \cdot \left(1 + \frac{s_1 + s_2 + \dots + s_{n-1}}{3 \cdot c} \right) \cdot \frac{1}{n}$$

Where $s_1, s_2, \dots, s_{n-1} \leq 3c$

And $c_{2,1}, c_{2,2} \geq 1,5c$

Combined tension and shear loading

The following equations must be satisfied

$$\beta_N \leq 1$$

$$\beta_V \leq 1$$

$$\beta_N + \beta_V \leq 1,2 \text{ or } \beta_N^\alpha + \beta_V^\alpha \leq 1$$

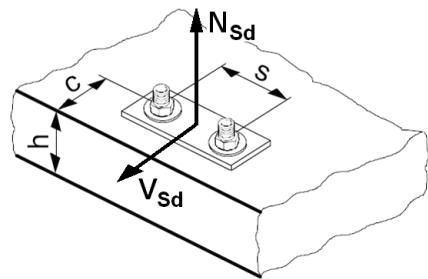

With

$$\beta_N = N_{Sd} / N_{Rd} \text{ and}$$

$$\beta_V = V_{Sd} / V_{Rd}$$

N_{Sd} (V_{Sd}) = tension (shear) design action

N_{Rd} (V_{Rd}) = tension (shear) design resistance

Annex C of ETAG 001

$\alpha = 2,0$ if N_{Rd} and V_{Rd} are governed by steel failure

$\alpha = 1,5$ for all other failure modes

Simplified design method

Failure mode is not considered for the simplified method

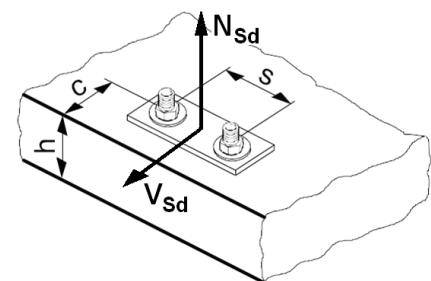

$\alpha = 1,5$ for all failure modes (leading to conservative results = being on the safe side)

Design example

Adhesive anchoring system with variable embedment depth in non-cracked concrete

Anchoring conditions

concrete	Non-cracked concrete C50/60	
service temperature range of base material	temperature range II	
number of anchors	Group of two anchors close to the edge	
base material thickness	h	100 mm
anchor spacing	s	150 mm
edge distance	c	100 mm
shear load direction perpendicular to free edge	β	0 °
TENSION design action (fixing point)	N_{Sd}	15,0 kN
SHEAR design action (fixing point)	V_{Sd}	15,0 kN
TENSION design action per anchor	$N_{Sd}^{(1)}$	7,5 kN
SHEAR design action per anchor	$V_{Sd}^{(1)}$	7,5 kN
effective anchorage depth	h_{ef}	70 mm

anchor	Hilti HIT-RE 500-SD with HIT-V 5.8, size M12	
external diameter	d	12 mm
typical anchorage depth	$h_{ef,typ}$	110 mm
minimum edge distance	s_{min}	60 mm
minimum spacing	c_{min}	60 mm

The parameters are given in the anchor-section in the tables "setting details" and "setting parameters" (for HIT-RE 500-SD with HIT-V 5.8, size M12)

Critical spacings and edge distances

critical spacing for concrete cone failure $s_{cr,N}$ and critical spacing for combined pull-out and concrete cone failure $s_{cr,Np}$

$$h_{ef} = 70 \text{ mm} \quad s_{cr,N} = s_{cr,Np} = 3 h_{ef} = 210 \text{ mm}$$

critical edge distance for concrete cone failure $c_{cr,N}$ and critical edge distance for combined pull-out and concrete cone failure $c_{cr,Np}$

$$h_{ef} = 70 \text{ mm} \quad c_{cr,N} = c_{cr,Np} = 1,5 h_{ef} = 105 \text{ mm}$$

critical edge distance for splitting failure

$$\text{for } h \leq 1,3 h_{ef} \quad c_{cr,sp} = 2,26 h_{ef}$$

$$\text{for } 1,3 h_{ef} < h < 2 h_{ef} \quad c_{cr,sp} = 4,6 h_{ef} - 1,8 h$$

$$\text{for } h \geq 2 h_{ef} \quad c_{cr,sp} = 1,0 h_{ef}$$

$$h = 100 \text{ mm} \quad h_{ef} = 70 \text{ mm} \quad h/h_{ef} = 1,43 \rightarrow c_{cr,sp} = 142 \text{ mm}$$

critical spacing for splitting failure

$$c_{cr,sp} = 142 \text{ mm} \quad s_{cr,sp} = 2 c_{cr,sp} = 284 \text{ mm}$$

General remarks

According EOTA Technical Report TR 029, concrete cone, combined concrete cone and pull-out, splitting, prayout and concrete edge design resistance must be verified for the anchor group. Steel design resistance must be verified for the most unfavourable anchor of the anchor group.

According to the simplified design method given in this Fastening Technology Manual all anchors of a group are loaded equally, the design resistance values given in the tables are valid for one anchor.

Tension loading

Design steel resistance

$N_{Rd,s} =$	28,0 kN
--------------	----------------

See "basic design tensile resistance"
(for HIT-RE 500-SD with HIT-V 5.8, size M12)

Design combined pull-out and concrete cone resistance

basic resistance			$N_{Rd,p}^0$	29,9 kN
concrete			$f_{B,p}$	1,09
$h_{ef} =$	70 mm	$h_{ef,typ} =$	$f_{h,p} = h_{ef}/h_{ef,typ} =$	0,64
$c =$	100 mm	$c_{cr,N} =$	$f_{1,N}$	0,99
$s =$	150 mm	$s_{cr,N} =$	$f_{2,N}$	0,97
$h_{ef} =$	70 mm		$f_{3,N}$	0,86
$N_{Rd,p} = N_{Rd,p}^0 f_{B,p} f_{1,N} f_{2,N} f_{3,N} f_{h,p} f_{re,N} =$				17,1 kN

See "basic design tensile resistance"
(for HIT-RE 500-SD with HIT-V 5.8, size M12)

Design concrete cone resistance

basic resistance			$N_{Rd,c}^0$	32,4 kN
concrete			f_B	1,55
$h_{ef} =$	70 mm	$h_{ef,typ} =$	$f_{h,N} = (h_{ef}/h_{ef,typ})^{1,5} =$	0,51
$c =$	100 mm	$c_{cr,N} =$	$f_{1,N}$	0,99
$s =$	150 mm	$s_{cr,N} =$	$f_{2,N}$	0,97
$h_{ef} =$	70 mm		$f_{3,N}$	0,86
$N_{Rd,c} = N_{Rd,c}^0 f_B f_{h,N} f_{1,N} f_{2,N} f_{3,N} f_{re,N} =$				21,1 kN

See "basic design tensile resistance"
(for HIT-RE 500-SD with HIT-V 5.8, size M12)
and "influencing factors"
(for HIT-RE 500-SD with HIT-V 5.8, size M12)

Influencing factors may be interpolated.

Design splitting resistance

basic resistance			$N_{Rd,sp}^0$	32,4 kN
concrete			f_B	1,55
$h_{ef} =$	70 mm	$h_{ef,typ} =$	$f_{h,N} = (h_{ef}/h_{ef,typ})^{1,5} =$	0,51
$c =$	100 mm	$c_{cr,sp} =$	$f_{1,sp}$	0,91
$s =$	150 mm	$s_{cr,sp} =$	$f_{2,sp}$	0,85
$h_{ef} =$	70 mm		$f_{3,sp}$	0,76
$N_{Rd,sp} = N_{Rd,sp}^0 f_B f_{h,N} f_{1,sp} f_{2,sp} f_{3,sp} f_{re,N} =$				15,0 kN

See "basic design tensile resistance"
(for HIT-RE 500-SD with HIT-V 5.8, size M12)
and "influencing factors"
(for HIT-RE 500-SD with HIT-V 5.8, size M12)

Influencing factors may be interpolated.

Tension design resistance: lowest value $N_{Rd} = 15,0 \text{ kN}$

Shear loading

Design steel resistance

$$V_{Rd,s} = 16,8 \text{ kN}$$

See "basic design shear resistance"
(for HIT-RE 500-SD with HIT-V 5.8, size M12)

Concrete prout design resistance

lower value of $N_{Rd,p}$ and $N_{Rd,c}$	$V^0 =$	17,1 kN
$h_{ef} = 70 \text{ mm}$	$\rightarrow k$	2
	$V_{Rd,cp} = k V^0 =$	34,3 kN

See "basic design shear resistance"
(for HIT-RE 500-SD with HIT-V 5.8, size M12)
and "influencing factors"
(for HIT-RE 500-SD with HIT-V 5.8, size M12)

Concrete edge design resistance

basic resistance	$V_{Rd,c}^0$	11,6 kN
concrete	f_B	1,55
shear load direction perpendicular to free edge	$0^\circ \rightarrow f_\beta$	1,00
$h = 100 \text{ mm}$	$c = 100 \text{ mm}$	$h/c = 1,00 \rightarrow f_h$
		0,82
$c = 100 \text{ mm}$	$h_{ef} = 70 \text{ mm}$	$c/h_{ef} = 1,43 \rightarrow f_4$
		1,28
$s = 150 \text{ mm}$	$h_{ef} = 70 \text{ mm}$	$s/h_{ef} = 2,14$
$h_{ef} = 70 \text{ mm}$	$d = 12 \text{ mm}$	$h_{ef}/d = 5,83 \rightarrow f_{hef}$
$c = 100 \text{ mm}$	$d = 12 \text{ mm}$	$c/d = 8,33 \rightarrow f_c$
		0,67
	$V_{Rd,c} = V_{Rd,c}^0 f_B f_\beta f_h f_4 f_{hef} f_c =$	12,3 kN

See "basic design shear resistance"
(for HIT-RE 500-SD with HIT-V 5.8, size M12)
and "influencing factors"
(for HIT-RE 500-SD with HIT-V 5.8, size M12)

Influencing factors may be interpolated.

Shear design resistance: lowest value

$$V_{Rd} = 12,3 \text{ kN}$$

Combined tension and shear loading

The following equation must be satisfied for combined tension and shear loads:

$$(Eq. 1) \quad (\beta_N)^{1,5} + (\beta_V)^{1,5} \leq 1$$

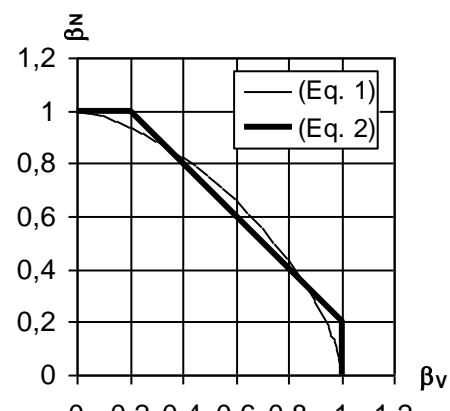

β_N (β_V) ratio between design action and design resistance for tension (shear) loading

According to ETAG 001, Annex C, the following simplified equation may be applied:

$$(Eq. 2) \quad \beta_N + \beta_V \leq 1,2 \quad \text{and} \quad \beta_N \leq 1, \beta_V \leq 1$$

Example (load values are valid for one anchor)

$N_{Sd}^{(1)} = 7,5 \text{ kN}$	$\beta_N = N_{Sd}^{(1)}/N_{Rd} = 0,500 \leq 1 \quad \checkmark$
$V_{Sd}^{(1)} = 7,5 \text{ kN}$	$\beta_V = V_{Sd}^{(1)}/V_{Rd} = 0,612 \leq 1 \quad \checkmark$
$N_{Rd} = 15,0 \text{ kN}$	$\beta_N + \beta_V = 1,112 \leq 1,2 \quad \checkmark$
$V_{Rd} = 12,3 \text{ kN}$	$(\beta_N)^{1,5} + (\beta_V)^{1,5} = 0,832 \leq 1 \quad \checkmark$

Dynamic loads (seismic, fatigue, shock)

Dynamic design for anchors

Actions

Common engineering design usually focuses around static loads. This chapter is intended to point out those cases, where static simplification may cause severe misjudgement and usually under-design of important structures.

Static loads

Static loads can be segregated as follows:

- Own (dead) weight
- Permanent actions
- Loads of non-loadbearing components
- Changing actions
- working loads (fitting / furnishing , machines, "normal" wear)
- Snow, Wind, Temperature

Material behaviour under static loading

The material behaviour under static loads is described essentially by the strength (tensile and compressive) and the elastic-plastic behaviour of the material. These properties are generally determined by carrying out tests according to the assessment guidelines.

Dynamic actions

The main difference between static and dynamic loads is the effectiveness of inertia and damping forces. These forces result from induced acceleration and must be taken into account when determining section forces and anchoring forces.

Typical Dynamic Actions

Dynamic actions can generally be classified into 3 different groups:

- Seismic loads
- Fatigue loads
- Shock loads

Seismic loads

Earthquakes

Seismic anchorage applications can include strengthening or retrofitting an existing structure, as well as standard anchorage applications that exist both in seismic and non-seismic geographies. In addition to an engineers focus on the anchoring of structural elements, it is crucial for an adequate seismic design to attend to non-load bearing and non-structural elements. These elements failure can severely compromise the building/structure functionality or repair costs after a seismic event.

Concrete should be assumed cracked

As a structure responds to earthquake ground motion it experiences displacement and consequently deformation of its individual members. This deformation leads to the formation and opening of cracks in members. Consequently all anchorages intended to transfer earthquake loads should be suitable for use in cracked concrete and their design should be predicted on the assumption that cracks in the concrete will cycle open and closed for the duration of the ground motion.

Anchors not recommended in plastic hinges areas

Parts of the structures may be subjected to extreme inelastic deformation as exposed in Fig. 1. In the reinforced areas yielding of the reinforcement and cycling of cracks may result in cracks width of several millimetres, particularly in regions of plastic hinges. Qualification procedures for anchors do not currently anticipate such large crack widths. For this reason, anchorages in this region where plastic hinging is expected to occur, such as the base of shear wall and joint regions of frames, should be avoided unless apposite design measures are taken.

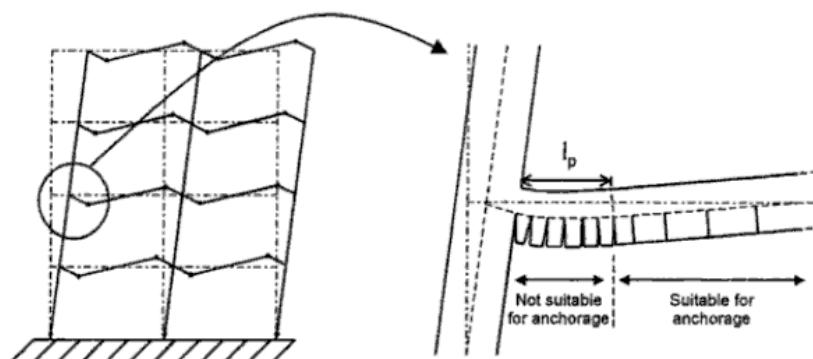

Fig 1: Member cracking assuming a strong-column, weak girder design

An anchor suitable (approved) to perform in a commonly defined cracked concrete, about 0.3 mm, is not consequently suitable to resist seismic actions, it's just a starting point.

During an earthquake cyclic loading of the structure and of the fastenings is induced simultaneously. Due to this the width of the cracks will vary between a minimum and a maximum value and the fastenings will be loaded cyclically. Specific testing programs and evaluation requirements are then necessary in order to evaluate the performance of an anchor subjected to seismic actions. Only the anchors approved after the mentioned procedure shall be specified for any safety relevant connection.

Anchors generally suitable for taking up seismic actions are those which can be given a controlled and sustained pre-tensioning force and are capable of re-expanding when cracking occurs. Also favorable are anchors which have an anchoring mechanism based on a keying (mechanical interlock) as it is the case for undercut anchors and concrete screws. Furthermore, some specific chemical anchors have also been recognized good performance to resist seismic actions, specially bond expansion anchors.

Additionally, Hilti's seismic research includes detailed investigation of product performance under simulated seismic conditions and full-scale system testing. This multilevel approach helps to capture the complexity of anchored system behaviour under seismic conditions.

In the United States the anchor seismic resistance shall be evaluated in accordance with ACI 318 Appendix D. Created in accordance with the ACI 355.2 regulated testing procedures and acceptance criteria ICC-ES AC193 and AC308, pre-qualification reports provide sound data in a proper design format.

With the release of the ETAG 001 Annex E in the first half of 2013, the seismic pre-qualification of anchors became regulated in Europe. Anchors submitted to these new test procedures will now also incorporate in the ETA (European Technical Approval) all the required technical data for seismic design. Until the release of the EN 1992-4, planned for 2015, EOTA TR045 (Technical Report) will set the standard for the seismic design of steel to concrete connections.

Therefore, the design framework for the seismic design of anchors is already available through both the U.S. and European regulations.

After a strong or design earthquake occasion, the ultimate loading capacity of an anchor is considerably reduced (30 to 80% of the original resistance). Proper inspection shall then be carried to ensure the level of performance not only for a future earthquake but also for the static load combinations.

Specific testing programs are needed to asses anchors

Anchors suitable to endure seismic loading

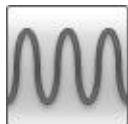

Full scale system testing

Seismic anchor design regulations landscape

After an earthquake

Fatigue loads

Fatigue

If an anchor is subjected to a sustained load that changes with respect to time, it can fail after a certain number of load cycles even though the upper limit of the load withstood up to this time is clearly lower than the ultimate tensile strength under static loading. This loss of strength is referred to as material fatigue. When evaluating actions causing fatigue also the planned or anticipated fastening life expectancy is of major importance.

Material behaviour under fatigue impact

The grade and quality of steel has a considerable influence on the alternating strength. In the case of structural and heat-treatable steels, the final strength (i.e. after 2 million load cycles or more) is approx. 25-35% of the static strength.

In the non-loaded state, concrete already has micro-cracks in the zone of contact of the aggregates and the cement paste, which are attributable to the aggregates hindering shrinkage of the cement paste. The fatigue strength of concrete is directly dependent on the grade of concrete. Concrete strength is reduced to about 55 – 65% of the initial strength after 2'000'000 load cycles.

Examples for Fatigue Loads

Two main groups of fatigue type loading can be identified:

- Vibration type loading of fasteners with very high recurrence and usually low amplitude (e.g. ventilators, production machinery, etc.).
- Repeated loading and unloading of structures with high loads and frequent recurrence (cranes, elevators, robots, etc.).

Shock loads

Shock

Shock-like phenomena have a very short duration and generally tremendously high forces which, however, only occur as individual peaks. As the probability of such a phenomenon to occur during the life expectancy of the building components concerned is comparably small, plastic deformations of fasteners and structural members are permitted according to the pre-qualification criteria.

Examples of Shock Loading

Shock loads are mostly unusual loading situations, even though sometimes they are the only loading case a structure is designed for (e.g. crash barriers, protection nets, ship or aeroplane impacts and falling rocks, avalanches and explosions, etc.).

Shock Testing

Load increase times in the range of milliseconds can be simulated during tests on servo-hydraulic testing equipment. The following main effects can then be observed:

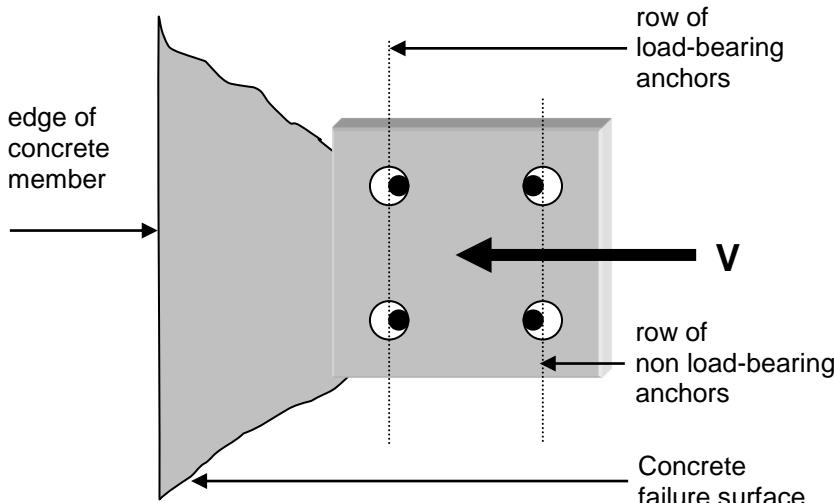

- Deformation is greater when the breaking load is reached
- The energy absorbed by an anchor is also much higher
- Breaking loads are of roughly the same magnitude during static loading and shock-loading tests

In this respect, more recent investigations show that the base material (cracked or non-cracked concrete), has no direct effect on the load-bearing behaviour.

Dynamic set for shear resistance upgrade

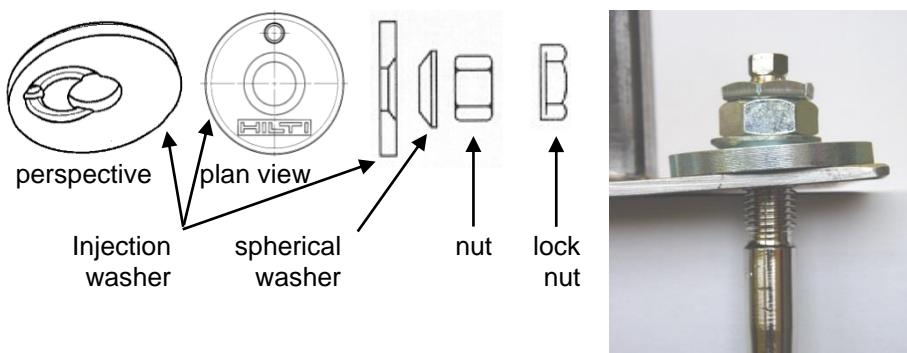

If a multiple-anchor fastening is loaded towards the edge of a concrete member (shear load), the gap between anchor shaft and clearance hole has an important role. An uneven shear load distribution within the anchors in the fastening is the result as the clearance hole is always larger than the anchor diameter to ensure an easy installation. Design methods take this fact into account by assuming that only the row of anchors nearest to the concrete edge takes up all shear load.

Uneven shear load distribution

The second row of anchors can be activated only after a considerable slip of the anchoring plate. This slip normally takes place after the edge failure of the outside row. The effect of the clearance hole gap on the internal load distribution increases if the shear load direction changes during the service life. To make anchors suitable for alternating shear loads, Hilti developed the so called Dynamic Set. This consists of a special washer, which permits HIT injection adhesive to be dispensed into the clearance hole, a spherical washer, a nut and a lock nut.

Activating the second row of anchors

Dynamic Set

Injection washer: Fills clearance hole and thus guarantees that the load is uniformly distributed among all anchors.

Improvements with Dynamic Set

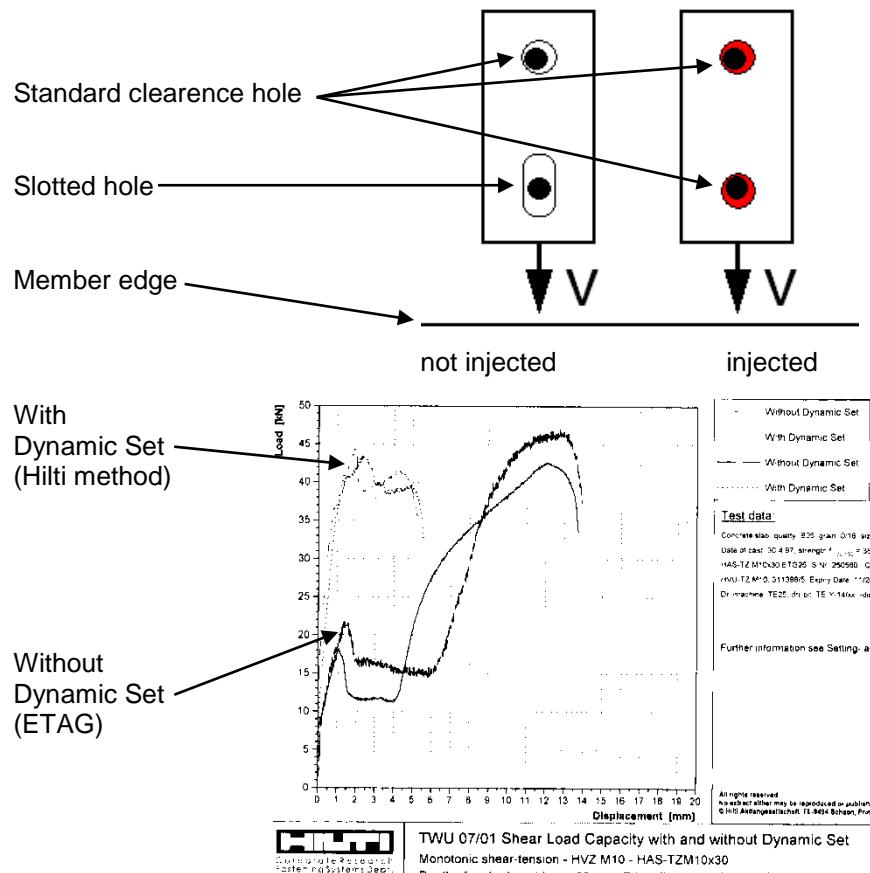

Spherical washer: Reduces bending moment acting on anchor shaft not set at right angles and thus increases the tensile loading capacity.

Lock nut: Prevents loosening of the nut and thus lifting of the anchoring plate away from the concrete in case of cyclic loading.

Delivery programme Dynamic Set: M10, M12, M16, M20

Shear resistance improvement with Dynamic Set

By using the dynamic set for static fastenings, the shear resistance is improved significantly. The unfavourable situation that only one row of anchors takes up all loads no longer exists and the load is distributed uniformly among all anchors. A series of experiments has verified this assumption. An example from this test programme, double fastenings with HVZ M10 anchors with and without the Dynamic Set are shown to compare resulting shear resistance and stiffness.

The test results show clearly that according to the current practice the second row of anchors takes up the load only after significant deformation of the plate, when the concrete edge has already failed. The injection and the Dynamic Set resulted in a continuous load increase until the whole multiple fastening fails.

When carrying out a simple fastening design, it may be assumed if the Dynamic Set is used the overall load bearing capacity of the multiple fastening is equal to the resistance of the first row of anchors multiplied by the number of rows in the fastening. In addition to that it must be checked whether the concrete edge resistance of the farthest row is smaller than the above mentioned resistance. If injection with the Dynamic Set is used, the ETAG restrictions on more than 6 anchor fastenings can be overcome.

Resistance to fire

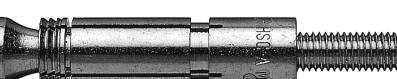

Tested fasteners for passive structural fire prevention

Tested according to the international standard temperature curve

Corrosion

Atmospheric corrosion of anchors

Importance

Corrosion is a process that affects metals due to their exposure to atmospheric influence. A greater concern is the safety risks, where corrosion can lead to significant impairment to the functionality of the fastening systems of the structural elements.

Hilti conducts comprehensive laboratory and field based tests to assess the corrosion resistance of its products. Thanks to the in-house research and close collaboration with renowned universities and laboratories, Hilti can offer the right solutions with the suitable corrosion protection for a wide variety of environmental conditions.

Process

Corrosion is expected to occur when the material, the protection or the structural design of a metallic component do not match the requirements imposed by the surrounding environment.

To evaluate the risk of corrosion, it is essential to assess the interaction between environmental conditions, material properties, material combinations and design characteristics.

To understand this interaction, you would need to consider the following influencing factors to atmospheric corrosion:

- **Humidity:** Is a requirement for all atmospheric corrosion reactions.
- **Temperature:** The higher the temperatures, the higher rate of corrosive attack.
- **Salt:** Salt-laden air near the sea coast and the salt used for de-icing in winter accelerate corrosion.
- **Industrial pollution:** The high content of sulphur dioxide accelerates corrosive reactions.
- **Bimetallic corrosion:** Is caused by the contact of dissimilar metals (where one metal is less noble than the other).

Corrosion protection

Corrosion protection is the principle measure to mitigate these risks.

Active corrosion protection comprises the measures that directly influence the corrosion reaction, e.g. galvanic separation, resistant materials, or cathodic protection.

Passive Corrosion Protection prevents or at least decelerates corrosion through the isolation of the metal material from the corrosive agent by the application of metallic or non-metallic protective layers of coating.

For fastening and installation systems, such as anchors, screws or channel supports, the use of resistant material or a protective coating is considered to be the safest and most economical corrosion protection method.

This chapter presents a general guideline for selecting a suitable corrosion protection method for fastening systems in commonly accepted applications for given environmental conditions.

Special applications demand special attention to the corrosion protection of the metallic components. This could be for example the conditions prevailing in road tunnels, buildings with indoor swimming pools, or in chemical plants. For such specific applications, it is advisable to consult a specialist. Your local, qualified Hilti engineers will be pleased to provide you with technical support on your application.

Zinc-coated carbon steel

Zinc coated steel typically corrodes uniformly. Steel corrosion starts when the zinc protection is mostly consumed.

On duplex-coated products the zinc is further protected by an organic or inorganic coating.

**Stainless steel**

Stainless steel has the ability to form very thin but dense oxide layers to protect the surface against corrosion. However, in highly corrosive environments, stainless steel may suffer from pitting corrosion, which is a localised attack that significantly decreases the lifetime of stainless steel.

Selection of corrosion protection for anchors

- = expected lifetime of anchors made from this material is typically satisfactory in the specified environment based on the typically expected lifetime of a building. The assumed service life in ETA approvals for powder-actuated and screw fasteners is 25 years, and for concrete anchors it is 50 years.
- = a decrease in the expected lifetime of non-stainless fasteners in these atmospheres must be taken into account (≤ 25 years). Higher expected lifetime needs a specific assessment.
- = fasteners made from this material are not suitable in the specified environment. Exceptions need a specific assessment.

From a technical point of view, HDG/duplex coatings and A2/304 material are suitable for outdoor environments with certain lifetime and application restrictions. This is based on longterm experience with these materials as reflected e.g. in the corrosion rates for Zn given in the ISO 9224:2012 (corrosivity categories, C-classes), the selection table for stainless steel grades given in the national technical approval issued by the DIBt Z.30.3-6 (April 2009) or the ICC-ES evaluation reports for our KB-TZ anchors for North America (e.g. ESR-1917, May 2013). The use of those materials in outdoor environments however is currently not covered by the European Technical Approval (ETA) of anchors, where it is stated that anchors made of galvanized carbon steel or stainless steel grade A2 may only be used in structures subject to dry indoor conditions, based on an assumed working life of the anchor of 50 years.

Environment categories

Applications can be classified into various environmental categories, by taking the following factors into account:

Indoor applications	
	Dry indoor environments (Heated or air-conditioning areas) without condensation, e.g. office buildings, schools.
	Indoor environments with temporary condensation (Unheated areas without pollutant) e.g. storage sheds

Outdoor applications	
	Outdoor, rural or urban environment with low population Large distance (> 10 km) from the sea
	Outdoor, rural or urban environment with moderate concentration of pollutants and/or salt from sea water Distance from the sea 1-10 km
	Coastal areas Distance from sea <1 km
	Outdoor areas with heavy industrial pollution Close to plants < 1 km (e.g. petrochemical, coal industry)
	Close proximity to roadways treated with de-icing salts Distance to roadways < 10 m

Outdoor applications	
	Special applications Areas with special corrosive conditions, e.g. road tunnels with de-icing salt, indoor swimming pools, special applications in the chemical industry (exceptions possible).

Important notes

The ultimate decision on the required corrosion protection must be made by the customer. Hilti accepts no responsibility regarding the suitability of a product for a specific application, even if informed of the application conditions.

The tables are based on an average service life for typical applications.

For metallic coatings, e.g. zinc layer systems, the end of lifetime is the point at which red rust is visible over a large fraction of the product and widespread structural deterioration can occur – the initial onset of rust may occur sooner.

National or international codes, standards or regulations, customer and/or industry specific guidelines must be independently considered and evaluated.

These guidelines apply to atmospheric corrosion only. Special types of corrosion, such as crevice corrosion or hydrogen assisted cracking must be independently evaluated.

The tables published in this brochure describe only a general guideline for commonly accepted applications in typical atmospheric environments.

Suitability for a specific application can be significantly affected by localised conditions, including but not limited to:

Elevated temperatures and humidity; High levels of airborne pollutants; Direct contact with corrosive products, such as found in some types of chemically-treated wood, waste water, concrete additives, cleaning agents, etc.; Direct contact to soil, stagnant water; Electrical current; Contact with dissimilar metals; Confined areas, e.g. crevices; Physical damage or wear; Extreme corrosion due to combined effects of different influencing factors; Enrichment of pollutants on the product

Typical examples of applications

Application	General conditions		Material	
Initial/carcass construction				
<i>Temporary fastening, maximum up to one year: Forming, site fixtures, scaffolding</i>	 	Outdoor and indoor applications	Electrogalvanised	
<i>Structural fastening: Brackets, columns, beams</i>		Dry indoor environments without condensation	Electrogalvanised	
		Damp inside rooms with occasional condensation due to high humidity and temperature fluctuations	Hot-dipped galvanised / sherardized min. 45 microns, A2 (304) and A4 (316) steel	
		Outdoor, rural or urban environment with low pollution. Large distance (>10km) from the sea.	Hot-dipped galvanised / sherardized min. 45 microns, A2 (304) and A4 (316) steel	
	  	Frequent and long-lasting condensation (greenhouses), open inside rooms or open halls/sheeds Or Outdoor, rural or urban environment with low pollution Or Coastal areas and areas with heavy industrial pollution	A4 (316) steel, possibly hot-dipped galvanised (depends on time of use)	
Interior finishing				
<i>Drywalls, suspended ceilings, windows, doors, railings / fences, elevators, fire escapes</i>		Dry indoor environments without condensation	Electrogalvanised	
Facades / roofing				
<i>Profiled metal sheets, curtain wall cladding, insulation fastenings, facade support framing</i>		Outdoor, rural or urban atmosphere with low pollution	Indoor	Electrogalvanised
			Outside application	Hot-dipped galvanised / sherardized min. 45 microns, A2 (304) and A4 (316) steel
		Outdoor, rural or urban environment with moderate concentration of pollutants	Indoor	Electrogalvanised
			Outside application	Hot-dipped galvanised / sherardized min. 45 microns, A2 (304) and A4 (316) steel
	 	Outdoor, areas with heavy industrial pollution and (e.g. petrochemical and coal industry) or coastal areas	Indoor	Electrogalvanised
			Outside application	A4 (316) steel, Hilti HCR if chlorides and industrial pollution are combined,

Application	General conditions		Material
Installations			
Conduit installation, cable runs, air ducts		Dry indoor environments without condensation	Electrogalvanised
<i>Electrical systems:</i> Runs, lighting, aerials		Damp inside rooms with occasional condensation due to high humidity and temperature fluctuations	Hot-dipped galvanised / sherardized min. 45 microns, A2 (304) and A4 (316) steel
<i>Industrial equipment:</i> Crane rails, barriers, conveyors, machine fastening		Outdoor, rural or urban environment with low pollution. Large distance (>10km) from the sea.	Hot-dipped galvanised / sherardized min. 45 microns, A2 (304) and A4 (316) steel
	 	Frequent and long-lasting condensation (greenhouses), open inside rooms or open halls/sheeds Or Outdoor, rural or urban environment with low pollution Or Coastal areas and areas with heavy industrial pollution	A4 (316) steel, possibly hot-dipped galvanised (depends on time of use)
Dock/harbour / port facilities / off-shore rigs			
Fastenings to quaysides, dock / harbour		Secondary relevance for safety, temporary fastenings	Electrogalvanised
		On the platform / rig	A4 (316) steels
		High humidity & temperature,, chlorides, often a superimposed "industrial atmosphere" or changes of oil / sea water, no whasing off	Hilti-HCR steel
Industry / chemical industry			
Conduit installation, cable runs, connecting structures, lighting		Dry indoor environments without condensation	Electrogalvanised
		Corrosive inside rooms, e.g. fastenings in laboratories, galvanising / plating plants etc., very corrosive vapours	A4 (316) steel, Hilti-HCR
		Outside applications, very heavy exposure to SO ₂ and additional corrosive substances	A4 (316) steel, Hilti-HCR
Sewage / waste water treatment			
Conduit installation, cable runs, connecting structures etc		In the atmosphere, high humidity, sewage / digester gases etc.	A4 (316) steel, hot-dipped galvanised / sherardized min. 45 microns
		Underwater applications, municipal sewage / waste water, industrial waste water	A4 (316) steel or Hilti-HCR depending on the water composition

Application	General conditions		Material
Tunnel construction - (Check Hilti tunnel brochure)			
Tunnel foils / sheeting, reinforcing mesh, traffic signs, lighting, tunnel wall cladding / lining, air ducts, ceiling suspensions, etc.		Secondary relevance for safety	A4 (316) steel
		Highly relevant to safety	Hilti-HCR steel
Road and bridge construction			
Conduit installation, cable runs, traffic signs, noise-insulating walls, crash barriers / guard rails, connecting structures		Directly weathered (chlorides are regularly washed off)	A4 (316) steel
		Frequently heavy exposure to deicing salt, no washing off, highly relevant to safety	Hilti HCR steel
Multi-storey car parks			
Fastening of, for example, guard rails, handrails, balustrades		Large amounts of chlorides (deicing salt) carried in by vehicles, many wet and dry cycles	A4 (316) steel, Hilti-HCR
Indoor swimming pools			
Fastening of, for example, service ladders, handrails, suspended ceilings		Fastenings relevant to safety	Hilti-HCR steel
Sports grounds / facilities / stadiums			
Fastening of, for example, seats, handrails, fences		Outdoor, rural or urban atmosphere with low pollution	Hot-dipped galvanised / sherardized min. 45 microns, A2 (304) and A4 (316) steel
		Outdoor, rural or urban environment with low pollution	Hot-dipped galvanised / sherardized min. 45 microns, A2 (304) and A4 (316) steel
		Coastal areas, inaccessible fastenings	A4 (316) steel

The following table shows the suitability of the respective metal couple. It also shows which two metals in contact are permissible in field practice and which should rather be avoided.

Fastened part (Large area)	Fastener (small area)				
	Electrogalvanised	Duplex coated carbon steel	Hot-dipped galvanised	Stainless steel	
Electrogalvanised	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Hot-dipped galvanised	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Aluminium	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Structural or cast steel	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Stainless steel (CrNi or CrNiMo)	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Tin	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Copper	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Brass	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

Slightly or no corrosion of fastener

Moderate corrosion of fastener, technically acceptable in many cases

Heavy corrosion of fastener

Hilti **SAFEset**

SAFEset system

Hilti Innovation

Cleaning the holes after drilling is seen by contractors around the world as a tedious and time-consuming part of the chemical anchor installation process. It requires the use of inconvenient tools and equipment such as steel brushes, compressed air or manual pumps. Proper borehole cleaning is essential for reliable anchor performance; however, this step in the installation process has long been a major concern for chemical anchor users everywhere.

Contractors and engineers who design anchor points and post-installed rebar can now have greater peace of mind regarding the installation quality by specifying Hilti **SAFEset** systems. The load performance on the jobsite will be as robust as the level it has been designed for.

Hilti **SAFEset** systems are a combination of anchor system components that significantly increase the anchor's robustness and dramatically reduce potential user errors during the installation process.

The new system eliminates the need for traditional borehole cleaning and makes dustless working possible for key applications. The Hilti **SAFEset** systems are supported with an ETA approval.

This unique approach to chemical anchor installation greatly increases customer productivity by reducing the time and labor costs associated with the traditional method.

Setting parameters

Anchor size	M8	M10	M12	M16	M20	M24	
Minimum base material thickness	h_{min} [mm]	120	140	160	200	250	300
Minimum spacing	s_{min} [mm]	60	70	80	100	125	150
	for $c \geq$ [mm]	100	100	160	240	300	300
Minimum edge distance	c_{min} [mm]	60	70	80	100	150	150
	for $s \geq$ [mm]	100	160	240	240	300	300
Critical spacing for splitting failure	$s_{cr,sp}$ [mm]	230	270	300	380	480	570
Critical edge distance for splitting failure	$c_{cr,sp}$ [mm]	115	135	150	190	240	285
Critical spacing for concrete cone failure	$s_{cr,N}$ [mm]	180	210	240	300	375	450
Critical edge distance for concrete cone failure	$c_{cr,N}$ [mm]	90	105	120	150	187,5	225

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced.

Critical spacing and critical edge distance for splitting failure apply only for non-cracked concrete. For cracked concrete only the critical spacing and critical edge distance for concrete cone failure are decisive.

Simplified design method

Simplified version of the design method according ETAG 001, Annex C. Design resistance according data given in ETA-02/0042, issue 2013-01-10.

- Influence of concrete strength
- Influence of edge distance
- Influence of spacing
- Valid for a group of two anchors. (The method may also be applied for anchor groups with more than two anchors or more than one edge. The influencing factors must then be considered for each edge distance and spacing. The calculated design loads are then on the safe side: They will be lower than the exact values according ETAG 001, Annex C. To avoid this, it is recommended to use the anchor design software PROFIS anchor)

The design method is based on the following simplification:

- No different loads are acting on individual anchors (no eccentricity)

The values are valid for one anchor.

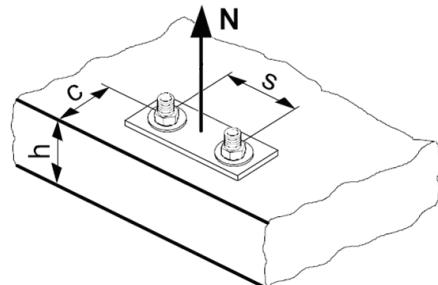

For more complex fastening applications please use the anchor design software PROFIS Anchor.

Tension loading

The design tensile resistance is the lower value of

- Steel resistance: $N_{Rd,s}$
- Concrete pull-out resistance: $N_{Rd,p} = N^0_{Rd,p} \cdot f_B$
- Concrete cone resistance: $N_{Rd,c} = N^0_{Rd,c} \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{re,N}$
- Concrete splitting resistance (only non-cracked concrete):

$$N_{Rd,sp} = N^0_{Rd,c} \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,sp} \cdot f_{re,N}$$

Basic design tensile resistance

Design steel resistance $N_{Rd,s}$

Anchor size	M8	M10	M12	M16	M20	M24
$N_{Rd,s}$ [kN]	19,5	30,9	44,9	83,7	130,7	188,3

Design pull-out resistance $N_{Rd,p} = N^0_{Rd,p} \cdot f_B$ (only M8, M10 in cracked concrete)

Anchor size	Non-cracked concrete						Cracked concrete					
	M8	M10	M12	M16	M20	M24	M8	M10	M12	M16	M20	M24
$N^0_{Rd,p}$ [kN]	No pull-out failure						6,7	10,7	No pull-out failure			

Design concrete cone resistance $N_{Rd,c} = N^0_{Rd,c} \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{re,N}$

Design splitting resistance ^{a)} $N_{Rd,sp} = N^0_{Rd,c} \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,sp} \cdot f_{re,N}$

Anchor size	Non-cracked concrete						Cracked concrete					
	M8	M10	M12	M16	M20	M24	M8	M10	M12	M16	M20	M24
$N^0_{Rd,c}$ [kN]	15,6	19,7	24,0	33,6	47,0	61,7	11,2	14,1	17,2	24,0	33,5	44,1

a) Splitting resistance must only be considered for non-cracked concrete

Influencing factors

Influence of concrete strength

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25N/mm^2)^{1/2}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of edge distance a)

c/c _{cr,N}	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
c/c _{cr,sp}										
$f_{1,N} = 0,7 + 0,3 \cdot c/c_{cr,N} \leq 1$	0,73	0,76	0,79	0,82	0,85	0,88	0,91	0,94	0,97	1
$f_{1,sp} = 0,7 + 0,3 \cdot c/c_{cr,sp} \leq 1$										
$f_{2,N} = 0,5 \cdot (1 + c/c_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{2,sp} = 0,5 \cdot (1 + c/c_{cr,sp}) \leq 1$										

a) The edge distance shall not be smaller than the minimum edge distance c_{min} given in the table with the setting details. These influencing factors must be considered for every edge distance.

Influence of anchor spacing a)

s/s _{cr,N}	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
s/s _{cr,sp}										
$f_{3,N} = 0,5 \cdot (1 + s/s_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{3,sp} = 0,5 \cdot (1 + s/s_{cr,sp}) \leq 1$										

a) The anchor spacing shall not be smaller than the minimum anchor spacing s_{min} given in the table with the setting details. This influencing factor must be considered for every anchor spacing.

Influence of base material thickness

h/h _{ef}	2,0	2,2	2,4	2,6	2,8	3,0	3,2	3,4	3,6	≥ 3,68
$f_{h,sp} = [h/(2 \cdot h_{ef})]^{2/3}$	1	1,07	1,13	1,19	1,25	1,31	1,37	1,42	1,48	1,5

Influence of reinforcement

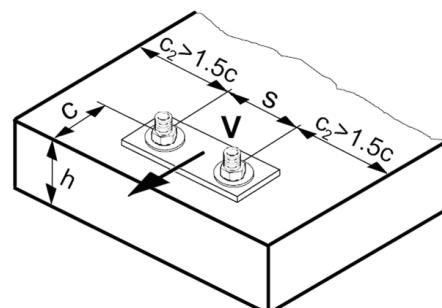

Anchor size	M8	M10	M12	M16	M20	M24
$f_{re,N} = 0,5 + h_{ef}/200mm \leq 1$	0,8 a)	0,85 a)	0,9 a)	1	1	1

a) This factor applies only for dense reinforcement. If in the area of anchorage there is reinforcement with a spacing ≥ 150 mm (any diameter) or with a diameter ≤ 10 mm and a spacing ≥ 100 mm, then a factor $f_{re,N} = 1$ may be applied.

Shear loading

The design shear resistance is the lower value of

- Steel resistance: $V_{Rd,s}$
- Concrete prout resistance: $V_{Rd,cp} = k \cdot N_{Rd,c}$
- Concrete edge resistance: $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Basic design shear resistance

Design steel resistance $V_{Rd,s}$

Anchor size		M8	M10	M12	M16	M20	M24
$V_{Rd,s}$	HSL-3, HSL-3-B, HSL-3-SK ^{a)} , HSL-3-SH ^{a)} [kN]	24,9	39,4	57,4	80,9	113,5	141,9
	HSL-3-G [kN]	20,9	27,8	43,4	68,6	113,5	-

a) HSL-3-SK and HSL-3-SH is only available up to M12

Design concrete prout resistance $V_{Rd,cp} = k \cdot N_{Rd,c}$ ^{a)}

Anchor size	M8	M10	M12	M16	M20	M24
k	1,8			2,0		

a) $N_{Rd,c}$: Design concrete cone resistance

Design concrete edge resistance ^{a)} $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_\beta \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Anchor size	Non-cracked concrete						Cracked concrete					
	M8	M10	M12	M16	M20	M24	M8	M10	M12	M16	M20	M24
$V_{Rd,c}^0$ [kN]	11,7	16,9	22,9	36,8	47,7	59,7	8,3	12,0	16,2	26,1	33,8	42,3

a) For anchor groups only the anchors close to the edge must be considered.

Influencing factors

Influence of concrete strength

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25\text{N/mm}^2)^{1/2}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of angle between load applied and the direction perpendicular to the free edge

Angle β	0°	10°	20°	30°	40°	50°	60°	70°	80°	≥ 90°
$f_\beta = \sqrt{\frac{1}{(\cos \alpha_v)^2 + \left(\frac{\sin \alpha_v}{2,5}\right)^2}}$	1	1,01	1,05	1,13	1,24	1,40	1,64	1,97	2,32	2,50

Influence of base material thickness

h/c	0,15	0,3	0,45	0,6	0,75	0,9	1,05	1,2	1,35	≥ 1,5
$f_h = \{h/(1,5 \cdot c)\}^{1/2} \leq 1$	0,32	0,45	0,55	0,63	0,71	0,77	0,84	0,89	0,95	1,00

Influence of anchor spacing and edge distance ^{a)} for concrete edge resistance: f_4
 $f_4 = (c/h_{ef})^{1,5} \cdot (1 + s / [3 \cdot c]) \cdot 0,5$

c/h _{ef}	Single anchor	Group of two anchors s/h _{ef}														
		0,75	1,50	2,25	3,00	3,75	4,50	5,25	6,00	6,75	7,50	8,25	9,00	9,75	10,50	11,25

a) The anchor spacing and the edge distance shall not be smaller than the minimum anchor spacing s_{min} and the minimum edge distance c_{min} .

Influence of embedment depth

Anchor size	M8	M10	M12	M16	M20	M24
$f_{hef} = 0,05 \cdot (h_{ef} / d)^{1,68}$	0,75	0,67	0,61	0,55	0,62	0,67

Influence of edge distance ^{a)}

c/d	4	6	8	10	15	20	30	40
$f_c = (d / c)^{0,19}$	0,77	0,71	0,67	0,65	0,60	0,57	0,52	0,50

a) The edge distance shall not be smaller than the minimum edge distance c_{min} .

Combined tension and shear loading

For combined tension and shear loading see section "Anchor Design".

Precalculated values

Design resistance calculated according ETAG 001, Annex C and data given in ETA-02/0042, issue 2013-01-10. All data applies to concrete C 20/25 – $f_{ck,cube} = 25 \text{ N/mm}^2$. HSL-3-SK and HSL-3-SH is only available up to M12.

Recommended loads can be calculated by dividing the design resistance by an overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Design resistance

Single anchor, no edge effects

		Non-cracked concrete						Cracked concrete

HSL-GR Heavy duty anchor, stainless steel

Anchor version	Benefits
 HSL-GR	<ul style="list-style-type: none"> - suitable for non-cracked C 20/25 to C 50/60 - high loading capacity - force-controlled expansion - reliable pull-down of the part fastened - no rotation in hole when tightening bolt

Concrete PROFIS
Anchor
design
software

Basic loading data (for a single anchor)

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Concrete as specified in the table
- Steel failure
- Minimum base material thickness
- Concrete C 20/25, $f_{ck,cube} = 25 \text{ N/mm}^2$

For details see Simplified design method

Mean ultimate resistance

Anchor size	Hilti technical data for non-cracked concrete				
	M8	M10	M12	M16	M20
Tensile $N_{Ru,m}$ [kN]	26,9	39,2	47,9	66,9	93,5
Shear $V_{Ru,m}$ [kN]	26,3	42,0	57,8	84,0	115,5

Characteristic resistance

Anchor size	Hilti technical data for non-cracked concrete				
	M8	M10	M12	M16	M20

Setting

installation equipment

Anchor size	M8	M10	M12	M16	M20
Rotary hammer	TE2 – TE16			TE40 – TE70	
Other tools			hammer, torque wrench, blow out pump		

Setting instruction

Drill hole.

Blow out dust and fragments.

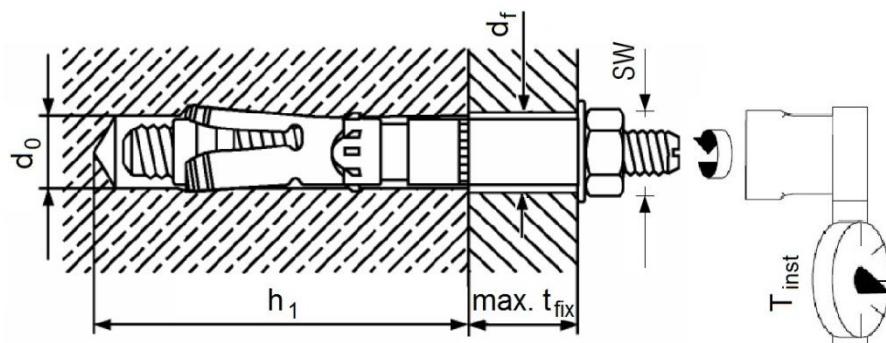

Install anchor.

Apply tightening torque

For detailed information on installation see instruction for use given with the package of the product.

For technical data for anchors in diamond drilled holes please contact the Hilti Technical advisory service.

Setting details: depth of drill hole h_1 and effective anchorage depth h_{ef}

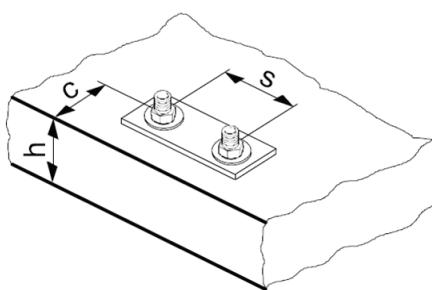

Setting details

Anchor size		M8	M10	M12	M16	M20
Nominal diameter of drill bit	d_o [mm]	12	15	18	24	26
Cutting diameter of drill bit	$d_{cut} \leq$ [mm]	12,5	15,5	18,5	24,55	28,55
Depth of drill hole	$h_1 \geq$ [mm]	80	90	105	125	155
Diameter of clearance hole in the fixture	$d_f \leq$ [mm]	14	17	20	26	31
Effective anchorage depth	h_{ef} [mm]	60	70	80	100	125
Torque moment	T_{inst} [Nm]	25	50	80	120	200
Width across	SW [mm]	13	17	19	24	30

Setting parameters

Anchor size		M8	M10	M12	M16	M20
Minimum base material thickness	h_{min} [mm]	120	140	160	200	250
Minimum spacing	s_{min} [mm]	100	160	240	240	300
Minimum edge distance	c_{min} [mm]	60	70	80	100	150
Critical spacing for splitting failure	$s_{cr,sp}$ [mm]	270	300	330	380	480
Critical edge distance for splitting failure	$c_{cr,sp}$ [mm]	135	150	165	190	240
Critical spacing for concrete cone failure	$s_{cr,N}$ [mm]	180	210	240	300	375
Critical edge distance for concrete cone failure	$c_{cr,N}$ [mm]	90	105	120	150	187,5

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced.

Critical spacing and critical edge distance for splitting failure apply only for non-cracked concrete. For cracked concrete only the critical spacing and critical edge distance for concrete cone failure are decisive.

Simplified design method

Simplified version of the design method according ETAG 001, Annex C.

- Influence of concrete strength
- Influence of edge distance
- Influence of spacing
- Valid for a group of two anchors. (The method may also be applied for anchor groups with more than two anchors or more than one edge. The influencing factors must then be considered for each edge distance)

and spacing. The calculated design loads are then on the safe side: They will be lower than the exact values according ETAG 001, Annex C.)

The design method is based on the following simplification:

- No different loads are acting on individual anchors (no eccentricity)

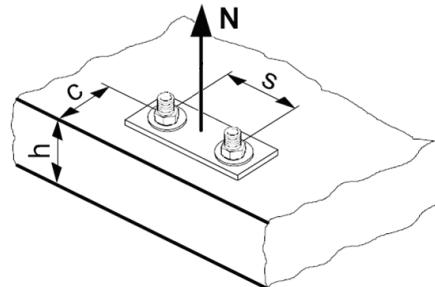

The values are valid for one anchor.

For more complex fastening applications please use the anchor design software PROFIS Anchor.

Tension loading

The design tensile resistance is the lower value of

- Steel resistance: $N_{Rd,s}$
- Concrete pull-out resistance: $N_{Rd,p} = N^0_{Rd,p} \cdot f_B$
- Concrete cone resistance: $N_{Rd,c} = N^0_{Rd,c} \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{re,N}$
- Concrete splitting resistance (only non-cracked concrete):
 $N_{Rd,sp} = N^0_{Rd,c} \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,sp} \cdot f_{re,N}$

Basic design tensile resistance

Design steel resistance $N_{Rd,s}$

Anchor size	M8	M10	M12	M16	M20
$N_{Rd,s}$ [kN]	13,7	21,7	31,6	58,8	91,7

Design pull-out resistance $N_{Rd,p} = N^0_{Rd,p} \cdot f_B$

Anchor size	M8	M10	M12	M16	M20
$N^0_{Rd,p}$ [kN]				No pull-out failure	

Design concrete cone resistance $N_{Rd,c} = N^0_{Rd,c} \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{re,N}$

Design splitting resistance $N_{Rd,sp} = N^0_{Rd,c} \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,sp} \cdot f_{re,N}$

Anchor size	M8	M10	M12	M16	M20
$N^0_{Rd,c}$ [kN]	13,0	16,4	20,1	28,1	39,2

Influencing factors

Influence of concrete strength

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25\text{N/mm}^2)^{1/2}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of edge distance ^{a)}

$c/c_{cr,N}$	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$c/c_{cr,sp}$										
$f_{1,N} = 0,7 + 0,3 \cdot c/c_{cr,N} \leq 1$	0,73	0,76	0,79	0,82	0,85	0,88	0,91	0,94	0,97	1
$f_{1,sp} = 0,7 + 0,3 \cdot c/c_{cr,sp} \leq 1$										
$f_{2,N} = 0,5 \cdot (1 + c/c_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{2,sp} = 0,5 \cdot (1 + c/c_{cr,sp}) \leq 1$										

- a) The edge distance shall not be smaller than the minimum edge distance c_{min} given in the table with the setting details. These influencing factors must be considered for every edge distance.

Influence of anchor spacing ^{a)}

$s/s_{cr,N}$	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$s/s_{cr,sp}$										
$f_{3,N} = 0,5 \cdot (1 + s/s_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{3,sp} = 0,5 \cdot (1 + s/s_{cr,sp}) \leq 1$										

- a) The anchor spacing shall not be smaller than the minimum anchor spacing s_{min} given in the table with the setting details. This influencing factor must be considered for every anchor spacing.

Influence of base material thickness

h/h_{ef}	2,0	2,2	2,4	2,6	2,8	3,0	3,2	3,4	3,6	$\geq 3,68$
$f_{h,sp} = [h/(2 \cdot h_{ef})]^{2/3}$	1	1,07	1,13	1,19	1,25	1,31	1,37	1,42	1,48	1,5

Influence of reinforcement

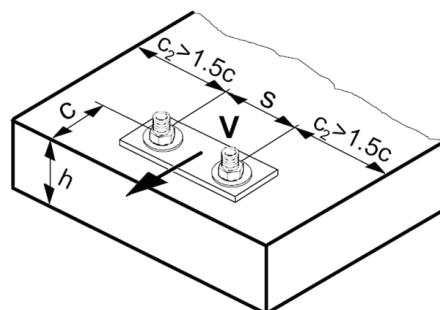

Anchor size	M8	M10	M12	M16	M20
$f_{re,N} = 0,5 + h_{ef}/200\text{mm} \leq 1$	0,8 ^{a)}	0,85 ^{a)}	0,9 ^{a)}	1	1

- a) This factor applies only for dense reinforcement. If in the area of anchorage there is reinforcement with a spacing ≥ 150 mm (any diameter) or with a diameter ≤ 10 mm and a spacing ≥ 100 mm, then a factor $f_{re,N} = 1$ may be applied.

Shear loading

The design shear resistance is the lower value of

- Steel resistance: $V_{Rd,s}$
- Concrete prout resistance: $V_{Rd,cp} = k \cdot N_{Rd,c}$
- Concrete edge resistance: $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_B \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Basic design shear resistance

Design steel resistance $V_{Rd,s}$

Anchor size	M8	M10	M12	M16	M20
$V_{Rd,s}$ [kN]	16,0	25,6	35,3	51,3	70,5

Design concrete prout resistance $V_{Rd,cp} = k \cdot N_{Rd,c}$ ^{a)}

Anchor size	M8	M10	M12	M16	M20
k	1,8			2,0	

a) $N_{Rd,c}$: Design concrete cone resistance

Design concrete edge resistance ^{a)} $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_\beta \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Anchor size	M8	M10	M12	M16	M20
$V_{Rd,c}^0$ [kN]	11,4	16,5	22,4	36,2	46,9

a) For anchor groups only the anchors close to the edge must be considered.

Influencing factors

Influence of concrete strength

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25\text{N/mm}^2)^{1/2}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of angle between load applied and the direction perpendicular to the free edge

Angle β	0°	10°	20°	30°	40°	50°	60°	70°	80°	≥ 90°

a) The anchor spacing and the edge distance shall not be smaller than the minimum anchor spacing s_{min} and the minimum edge distance c_{min} .

Influence of embedment depth

Anchor size	M8	M10	M12	M16	M20
$f_{hef} = 0,05 \cdot (h_{ef} / d)^{1,68}$	0,75	0,67	0,61	0,55	0,62

Influence of edge distance ^{a)}

c/d	4	6	8	10	15	20	30	40
$f_c = (d / c)^{0,19}$	0,77	0,71	0,67	0,65	0,60	0,57	0,52	0,50

a) The edge distance shall not be smaller than the minimum edge distance c_{min} .

Combined tension and shear loading

For combined tension and shear loading see section "Anchor Design".

Precalculated values

Recommended loads can be calculated by dividing the design resistance by an overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Design resistance

Single anchor, no edge effects

Anchor size	M8	M10	M12	M16	M20
Min. base material thickness h_{\min} [mm]	120	140	160	200	250
Tensile N_{Rd}					
HSL-GR	[kN]	13,0	16,4	20,1	28,1
Shear V_{Rd}, without lever arm					
HSL-GR	[kN]	16,0	25,6	35,3	51,3
					70,5

Single anchor, min. edge distance ($c = c_{\min}$)

Anchor size	M8	M10	M12	M16	M20
Min. base material thickness h_{\min} [mm]	120	140	160	200	250
Min. edge distance c_{\min} [mm]	60	70	80	100	125
Tensile N_{Rd}					
HSL-GR	[kN]	7,8	10,1	12,6	18,4
Shear V_{Rd}, without lever arm					
HSL-GR	[kN]	6,4	8,4	10,6	15,5
					28,1

Double anchor, no edge effects, min. spacing ($s = s_{\min}$), (load values are valid for one anchor)

Anchor size	M8	M10	M12	M16	M20
Min. base material thickness h_{\min} [mm]	120	140	160	200	250
Min. spacing s_{\min} [mm]	100	160	240	240	300
Tensile N_{Rd}					
HSL-GR	[kN]	8,9	12,6	17,3	22,9
Shear V_{Rd}, without lever arm					
HSL-GR	[kN]	16,0	25,6	35,3	51,3
					70,5

HDA Design anchor

Anchor version	Benefits
  HDA-P HDA-PR HDA-PF Anchor for pre-setting	<ul style="list-style-type: none"> - suitable for non-cracked and cracked concrete C 20/25 to C 50/60 - mechanical interlock (undercut) - low expansion force (thus small edge distance / spacing) - automatic undercutting (without special undercutting tool) - high loading capacity, performance of a headed stud - complete system (anchor, stop drill bit, setting tool, drill hammer) - setting mark on anchor for control (easy and safe) - completely removable - test reports: fire resistance, fatigue, shock, seismic

Fire test report	IBMB, Braunschweig	UB 3039/8151-CM / 2001-01-31
Assessment report (fire)	warringtonfire	WF 327804/A / 2013-07-10

a) All data for HDA-P(R) and HDA-T(R) given in this section according ETA-99/0009, issue 2013-03-25.
 Sherardized versions HDA-PF and HDA-TF anchors are not covered by the approvals.

Basic loading data (for a single anchor)

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Concrete as specified in the table
- Steel failure
- Minimum base material thickness
- Concrete C 20/25, $f_{ck,cube} = 25 \text{ N/mm}^2$

For details see Simplified design method

b) With overall partial safety factor for action $\gamma_F = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

c) HDA-PF and HDA-TF anchors are not covered by ETA-99/0009

d) With use of centering washer (t = 5 mm) only

Materials

Mechanical properties of HDA

Anchor size	HDA-P(F), HDA-T(F)				HDA-PR, HDA-TR		
	M10	M12	M16	M20 ^{a)}	M10	M12	M16
Anchor bolt							
Nominal tensile strength f_{uk} [N/mm ²]	800	800	800	800	800	800	800
Yield strength f_{yk} [N/mm ²]	640	640	640	640	600	600	600
Stressed cross-section A_s [mm ²]	58,0	84,3	157	245	58,0	84,3	157
Moment of resistance W_{el} [mm ³]	62,3	109,2	277,5	540,9	62,3	109,2	277,5
Characteristic bending resistance without sleeve [Nm] $M_{Rk,s}^0$ ^{b)}	60	105	266	519	60	105	266
Anchor sleeve							
Nominal tensile strength f_{uk} [N/mm ²]	850	850	700	550	850	850	700
Yield strength f_{yk} [N/mm ²]	600	600	600	450	600	600	600

a) HDA M20: only a galvanized 5µm version is available

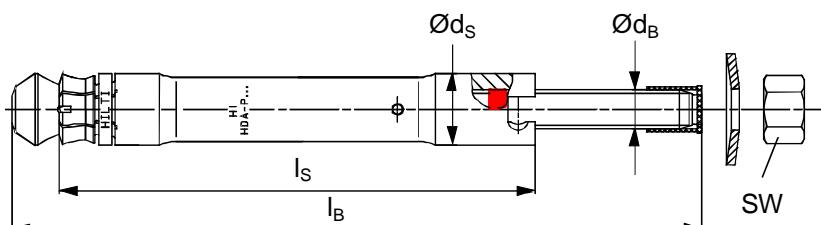

b) The recommended bending moment of the HDA anchor bolt may be calculated from $M_{rec} = M_{Rd,s} / \gamma_F = M_{Rk,s} / (\gamma_{Ms} \cdot \gamma_F) = (1,2 \cdot W_{el} \cdot f_{uk}) / (\gamma_{Ms} \cdot \gamma_F)$, where the partial safety factor for bolts of strength 8.8 is $\gamma_{MS} = 1,25$, for A4-80 equal to 1,33 and the partial safety factor for action may be taken as $\gamma_F = 1,4$. In case of HDA-T/TR/TF the bending capacity of the sleeve is neglected, only the capacity of the bolt is taken into account.

Material quality

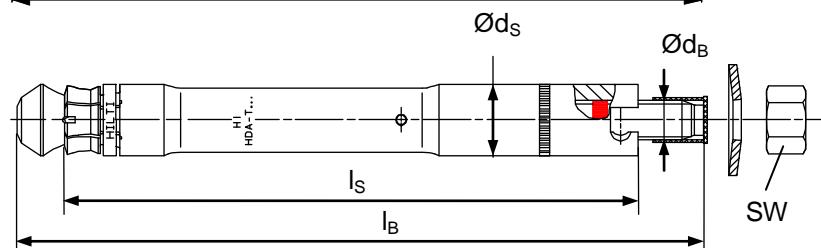

Part	Material
HDA-P / HDA-T (Carbon steel version)	
Sleeve:	Machined steel with brazed tungsten carbide tips, galvanised to min. 5 µm
Bolt M10 - M16:	Cold formed steel, strength 8.8, galvanised to min. 5 µm
Bolt M20:	Cone machined, rod strength 8.8, galvanised to min. 5 µm
HDA-PR / HDA-TR (Stainless steel version)	
Sleeve:	Machined stainless steel with brazed tungsten carbide tips
Bolt M10 - M16:	Cone/rod: machined stainless steel
HDA-PF / HDA-TF (Sherardized version)	
Sleeve:	Machined steel with brazed tungsten carbide tips, shearadized
Bolt M10 - M16:	Cold formed steel, strength 8.8, shearadized

Max. fixture thickness	t _{fix,max} [mm]	20	30	50	40	60	50

a) use specified stop drill bit

b) with use of centering washer a reduction of t_{fix,min} is possible for shear loading, details see ETA-99/0009

Setting parameters

Anchor size	HDA-P / HDA-PR / HDA-PF / HDA-T / HDA-TR / HDA-TF			
	M10 x100/20	M12 x125/30 x125/50	M16 x190/40 x190/60	M20 x250/50 x250/100
Minimum spacing s_{\min} [mm]	100	125	190	250
Minimum edge distance c_{\min} [mm]	80	100	150	200
Critical spacing for splitting failure $s_{cr,sp}$ [mm]	300	375	570	750
Critical edge distance for splitting failure $c_{cr,sp}$ [mm]	150	190	285	375
Critical spacing for concrete cone failure $s_{cr,N}$ [mm]	300	375	570	750
Critical edge distance for concrete cone failure $c_{cr,N}$ [mm]	150	190	285	375

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced.

Critical spacing and critical edge distance for splitting failure apply only for non-cracked concrete. For cracked concrete only the critical spacing and critical edge distance for concrete cone failure are decisive.

Simplified design method

Simplified version of the design method according ETAG 001, Annex C. Design resistance according data given in ETA-99/0009, issue 2013-03-25.

- Influence of concrete strength
- Influence of edge distance
- Influence of spacing
- Valid for a group of two anchors. (The method may also be applied for anchor groups with more than two anchors or more than one edge. The influencing factors must then be considered for each edge distance and spacing. The calculated design loads are then on the safe side: They will be lower than the exact values according ETAG 001, Annex C. To avoid this, it is recommended to use the anchor design software PROFIS anchor)

The design method is based on the following simplification:

- No different loads are acting on individual anchors (no eccentricity)

The values are valid for one anchor.

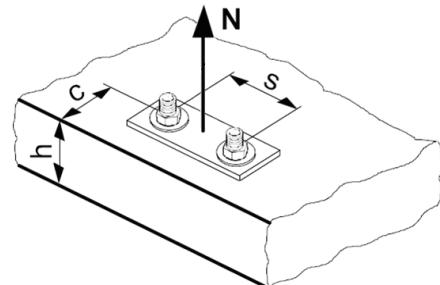

For more complex fastening applications please use the anchor design software PROFIS Anchor.

Tension loading

The design tensile resistance is the lower value of

- Steel resistance: $N_{Rd,s}$
- Concrete pull-out resistance: $N_{Rd,p} = N^0_{Rd,p} \cdot f_B$
- Concrete cone resistance: $N_{Rd,c} = N^0_{Rd,c} \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{re,N}$
- Concrete splitting resistance (only non-cracked concrete):

$$N_{Rd,sp} = N^0_{Rd,c} \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,sp} \cdot f_{re,N}$$

Basic design tensile resistance

Design steel resistance $N_{Rd,s}$

Influence of concrete strength

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25\text{N/mm}^2)^{1/2}$ ^{a)}	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of edge distance ^{a)}

$c/c_{cr,N}$	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$c/c_{cr,sp}$										
$f_{1,N} = 0,7 + 0,3 \cdot c/c_{cr,N} \leq 1$	0,73	0,76	0,79	0,82	0,85	0,88	0,91	0,94	0,97	1
$f_{1,sp} = 0,7 + 0,3 \cdot c/c_{cr,sp} \leq 1$										
$f_{2,N} = 0,5 \cdot (1 + c/c_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{2,sp} = 0,5 \cdot (1 + c/c_{cr,sp}) \leq 1$										

- a) The edge distance shall not be smaller than the minimum edge distance c_{min} given in the table with the setting details. These influencing factors must be considered for every edge distance.

Influence of anchor spacing ^{a)}

$s/s_{cr,N}$	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$s/s_{cr,sp}$										
$f_{3,N} = 0,5 \cdot (1 + s/s_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{3,sp} = 0,5 \cdot (1 + s/s_{cr,sp}) \leq 1$										

- a) The anchor spacing shall not be smaller than the minimum anchor spacing s_{min} given in the table with the setting details. This influencing factor must be considered for every anchor spacing.

Influence of base material thickness

h/h_{ef}	2	2,2	2,4	2,6	2,8	3	3,2	3,4	3,6	$\geq 3,68$
$f_{h,sp} = [h/(2 \cdot h_{ef})]^{2/3}$	1	1,07	1,13	1,19	1,25	1,31	1,37	1,42	1,48	1,5

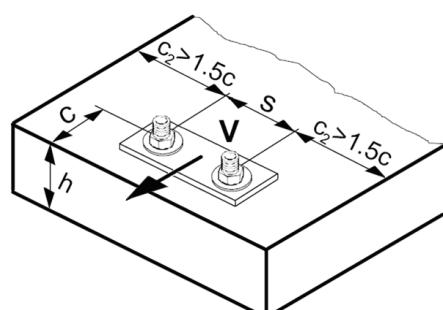

Influence of reinforcement

Anchor size	M10	M12	M16	M20
$f_{re,N} = 0,5 + h_{ef}/200\text{mm} \leq 1$			1	

Shear loading

The design shear resistance is the lower value of

- Steel resistance: $V_{Rd,s}$
- Concrete prout resistance: $V_{Rd,cp} = k \cdot N_{Rd,c}$
- Concrete edge resistance: $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_B \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Basic design shear resistance**Design steel resistance $V_{Rd,s}$**

Anchor size		M10	M12	M16	M20 ^{a)}
$V_{Rd,s}$	HDA-P, HDA-PF [kN]	17,6	24,0	49,6	73,6
	HDA-PR [kN]	17,3	25,6	47,4	-
	HDA-T, HDA-TF ^{b)} [kN]	43,3	53,3	93,3	136,7
	HDA-TR ^{b)} [kN]	53,4	65,4	114,3	-

a) HDA M20: only a galvanized 5µm version is available

b) Values are valid for minimum thickness of the base plate $t_{fix,min}$. For characteristic resistance to shear loads with thicker base plates see ETA-99/0009 or use PROFIS software.**Design concrete prout resistance $V_{Rd,cp} = k \cdot N_{Rd,c}$ ^{a)}**

Anchor size	M10	M12	M16	M20
k			2,0	

a) $N_{Rd,c}$: Design concrete cone resistance**Design concrete edge resistance ^{a)} $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_\beta \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$**

Anchor size	Non-cracked concrete				Cracked concrete			
	M10	M12	M16	M20 ^{b)}	M10	M12	M16	M20 ^{b)}
$V_{Rd,c}^0$ [kN]	25,1	29,8	51,1	70,0	17,8	21,1	36,2	49,6

a) For anchor groups with more than two anchors only the anchors close to the edge must be considered.

b) HDA M20: only a galvanized 5µm version is available

Influencing factors**Influence of concrete strength**

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25N/mm^2)^{1/2}$ ^{a)}	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length**Influence of angle between load applied and the direction perpendicular to the free edge**

Angle β	0°	10°	20°	30°	40°	50°	60°	70°	80°	≥ 90°
$f_\beta = \sqrt{\frac{1}{(\cos \alpha_v)^2 + \left(\frac{\sin \alpha_v}{2,5}\right)^2}}$	1	1,01	1,05	1,13	1,24	1,40	1,64	1,97	2,32	2,50

Influence of base material thickness

h/c	0,15	0,3	0,45	0,6	0,75	0,9	1,05	1,2	1,35	≥ 1,5
$f_h = \{h/(1,5 \cdot c)\}^{1/2} \leq 1$	0,32	0,45	0,55	0,63	0,71	0,77	0,84	0,89	0,95	1,00

Influence of anchor spacing and edge distance ^{a)} for concrete edge resistance: f_4
 $f_4 = (c/h_{ef})^{1,5} \cdot (1 + s / [3 \cdot c]) \cdot 0,5$

c/h _{ef}	Single anchor	Group of two anchors s/h _{ef}														
		0,75	1,50	2,25	3,00	3,75	4,50	5,25	6,00	6,75	7,50	8,25	9,00	9,75	10,50	11,25

- a) The anchor spacing and the edge distance shall not be smaller than the minimum anchor spacing s_{min} and the minimum edge distance c_{min} .

Influence of embedment depth

Anchor size	M10	M12	M16	M20
$f_{hef} = 0,05 \cdot (h_{ef} / d)^{1,68}$	0,81	1,00	1,18	1,36

Influence of edge distance ^{a)}

c/d	4	6	8	10	15	20	30	40
$f_c = (d / c)^{0,19}$	0,77	0,71	0,67	0,65	0,60	0,57	0,52	0,50

- a) The edge distance shall not be smaller than the minimum edge distance c_{min} .

Combined tension and shear loading

For combined tension and shear loading see section "Anchor Design".

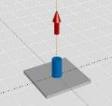

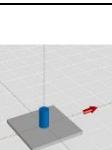

Precalculated values

Design resistance calculated according ETAG 001, Annex C and data given in ETA-99/0009, issue 2013-03-25. All data applies to concrete C 20/25 – $f_{ck,cube} = 25 \text{ N/mm}^2$. HDA-PF and HDA-TF anchors are not covered by the approval. For HDA-T and HDA-TR anchors the resistance to shear loads is calculated for the minimum thickness of the base plate given in chapter setting details.

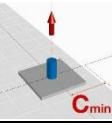

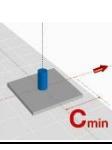

Recommended loads can be calculated by dividing the design resistance by an overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Design resistance

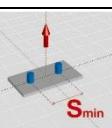

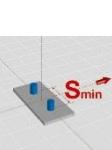

Single anchor, no edge effects, shear without lever arm

Anchor size	Non-cracked concrete				Cracked concrete				
	M10	M12	M16	M20	M10	M12	M16	M20

HMU-PF Undercut anchor

Anchor version	Benefits
	M12 HMU-PF <ul style="list-style-type: none"> - reliable mechanical interlock due to consistent high quality undercut - comes standard with a hot-dip galvanized protective coating against corrosion - cost efficient heavy duty anchoring solution for high volume fastenings - easy verification of correct setting due to red setting mark - optimized and matching system components enable efficient and reliable installation
	M16 HMU-PF

Description	Authority / Laboratory	No. / date of issue
European Technical Assessment	CSTB, Paris	ETA-14/0069 / 2014-04-02
Shockproof fastenings in civil defence installations	Federal Office for Civil Protection, Bern	BZS D 14-602/ 2014-10-31

a) All data given in this section for HMU-PF M12 and M16 according to ETA-14/0001, issue 2014-04-02.

Basic loading data (for a single anchor)

All data in this section is applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Concrete as specified in the table
- Steel/failure
- Minimum base material thickness
- Concrete C 20/25, $f_{ck,cube} = 25 \text{ N/mm}^2$

For details see Simplified design method

Minimum base material thickness $h_{min} \geq$ [mm]	160	200	250
Minimum spacing $s_{min} \geq$ [mm]	90	100	100
Minimum edge distance $c_{min} \geq$ [mm]	90	100	100
Critical spacing for splitting failure $s_{cr,sp}$ [mm]	300	300	375
Critical edge distance for splitting failure $c_{cr,sp}$ [mm]	150	150	188
Critical spacing for concrete cone failure $s_{cr,N}$ [mm]	240	300	375
Critical edge distance for concrete cone failure $c_{cr,N}$ [mm]	120	150	188

- b) In case of smaller edge distance and spacing than $c_{cr,sp}$, $s_{cr,sp}$, $c_{cr,N}$ and $s_{cr,N}$ the load values shall be reduced according ETAG 001, Annex C

Critical spacing and critical edge distance for splitting failure apply only for non-cracked concrete. For cracked concrete only the critical spacing and critical edge distance for concrete cone failure are decisive.

Simplified design method

Simplified version of the design method according ETAG 001, Annex C. Design resistance according data given in ETA-14/0069, issue 2014-04-02.

- Influence of concrete strength
- Influence of edge distance
- Influence of spacing
- Valid for a group of two anchors. The method may also be applied for anchor groups with more than two anchors or more than one edge. The influencing factors must then be considered for each edge distance and spacing. The calculated design loads are then on the safe side: They will be lower than the exact values according ETAG 001, Annex C.

The design method is based on the following simplification:

- No different loads are acting on individual anchors (no eccentricity)

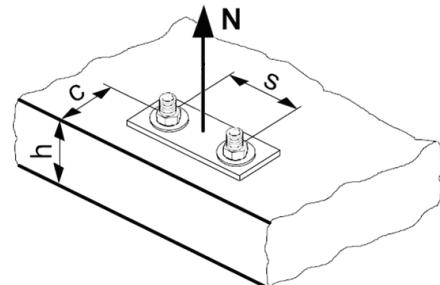

The values are valid for one anchor.

For more complex fastening applications please use the anchor design software PROFIS Anchor.

Tension loading

The design tensile resistance is the lower value of

- Steel resistance: $N_{Rd,s}$
- Concrete pull-out resistance: $N_{Rd,p} = N_{Rd,c}^0 \cdot f_B$
- Concrete cone resistance: $N_{Rd,c} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{re,N}$
- Concrete splitting resistance (only non-cracked concrete):
 $N_{Rd,sp} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,sp} \cdot f_{re,N}$

Basic design tensile resistance

Design steel resistance $N_{Rd,s}$

Anchor size	HMU-PF	M12x80	M16x100	M16x125
$N_{Rd,s}$	[kN]	44,9		83,7

Design pull-out resistance $N_{Rd,p} = N_{Rd,c}^0 \cdot f_B$

Anchor size	HMU-PF	Non-cracked concrete			Cracked concrete		
		M12x80	M16x100	M16x125	M12x80	M16x100	M16x125
Effective anchorage depth $h_{ef} \geq$	[mm]	80	100	125	80	100	125
$N_{Rd,p}^0$	[kN]	N.A.			13,3	N.A.	26,7

Design concrete cone resistance $N_{Rd,c} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{re,N}$

Design splitting resistance ^{a)} $N_{Rd,sp} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,sp} \cdot f_{re,N}$

Anchor size	HMU-PF	Non-cracked concrete			Cracked concrete		
		M12x80	M16x100	M16x125	M12x80	M16x100	M16x125
Effective anchorage depth $h_{ef} \geq$	[mm]	80	100	125	80	100	125
$N_{Rd,c}^0$	[kN]	24,1	33,7	47,1	17,2	24,0	33,5

Influencing factors

Influence of concrete strength on pull-out, concrete cone and splitting resistance

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25\text{N/mm}^2)^{1/2}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of edge distance ^{a)}

c/c_{cr,N}	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
c/c_{cr,sp}										
f _{1,N} = 0,7 + 0,3·c/c _{cr,N} ≤ 1	0,73	0,76	0,79	0,82	0,85	0,88	0,91	0,94	0,97	1
f _{1,sp} = 0,7 + 0,3·c/c _{cr,sp} ≤ 1										
f _{2,N} = 0,5·(1 + c/c _{cr,N}) ≤ 1	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
f _{2,sp} = 0,5·(1 + c/c _{cr,sp}) ≤ 1										

a) The edge distance shall not be smaller than the minimum edge distance c_{min} given in the table with the setting details. These influencing factors must be considered for every edge distance.

Influence of anchor spacing ^{a)}

s/s_{cr,N}	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
s/s_{cr,sp}										
f _{3,N} = 0,5·(1 + s/s _{cr,N}) ≤ 1	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
f _{3,sp} = 0,5·(1 + s/s _{cr,sp}) ≤ 1										

a) The anchor spacing shall not be smaller than the minimum anchor spacing s_{min} given in the table with the setting details. This influencing factor must be considered for every anchor spacing.

Influence of base material thickness

h/h_{ef}	2,0	2,2	2,4	2,6	2,8	3,0	3,2	3,4	3,6	≥ 3,68
f _{h,sp} = [h/(2·h _{ef})] ^{2/3}	1	1,07	1,13	1,19	1,25	1,31	1,37	1,42	1,48	1,5

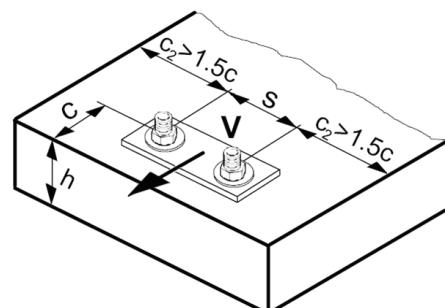

Influence of reinforcement

Anchor size	M12x80	M16x100	M16x125
f _{re,N} = 0,5 + h _{ef} /200mm ≤ 1	0,9	1	1

Shear loading

The design shear resistance is the lower value of

- Steel resistance: $V_{Rd,s}$
- Concrete prout resistance: $V_{Rd,cp} = k \cdot N_{Rd,c}$
- Concrete edge resistance: $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_B \cdot f_h \cdot f_4 \cdot f_c$

Basic design shear resistance

Design steel resistance $V_{Rd,s}$

Anchor size	HMU-PF M12x80	HMU-PF M16x100	HMU-PF M16x125
V _{Rd,s} [kN]	27,0	50,2	

Design concrete prout resistance $V_{Rd,cp} = k \cdot N_{Rd,c}$ ^{a)}

Anchor size	HMU-PF M12x80	HMU-PF M16x100	HMU-PF M16x125
k		2	

a) $N_{Rd,c}$: Design concrete cone resistance

Design concrete edge resistance $V_{Rd,c}^0 = V_{Rd,c}^0 \cdot f_B \cdot f_\beta \cdot f_h \cdot f_4 \cdot f_c$

Anchor size	HMU-PF	Non-cracked concrete			Cracked concrete		
		M12x80	M16x100	M16x125	M12x80	M16x100	M16x125
Effective anchorage depth $h_{ef} \geq$	[mm]	80	100	125	80	100	125
$V_{Rd,c}^0$	[kN]	22,9	36,8	47,7	16,2	26,1	33,8

a) For anchor groups only the anchors close to the edge must be considered.

Influencing factors

Influence of concrete strength

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60

- a) The anchor spacing and the edge distance shall not be smaller than the minimum anchor spacing s_{\min} and the minimum edge distance c_{\min} .

Influence of edge distance^{a)}

c/d	4	6	8	10	15	20	30	40
$f_c = (d / c)^{0,19}$	0,77	0,71	0,67	0,65	0,60	0,57	0,52	0,50

- a) The edge distance shall not be smaller than the minimum edge distance c_{\min} .

Combined tension and shear loading

The following equations must be satisfied

$$\beta_N \leq 1$$

$$\beta_V \leq 1$$

$$\beta_N + \beta_V \leq 1,2 \quad \text{or} \quad \beta_N^\alpha + \beta_V^\alpha \leq 1$$

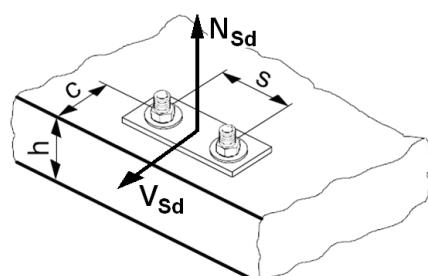

With

$$\beta_N = N_{\text{Sd}} / N_{\text{Rd}}$$
 and

$$\beta_V = V_{\text{Sd}} / V_{\text{Rd}}$$

N_{Sd} (V_{Sd}) = tension (shear) design action

N_{Rd} (V_{Rd}) = tension (shear) design resistance

Annex C of ETAG 001

$\alpha = 2,0$ if N_{Rd} and V_{Rd} are governed by steel failure

$\alpha = 1,5$ for all other failure modes

Simplified design method

Failure mode is not considered for the simplified method

$\alpha = 1,5$ for all failure modes (leading to conservative results)

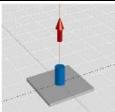

Precalculated values

Design resistance calculated according ETAG 001, Annex C and data given in ETA-14/0069, issue 2014-04-02. All data applies to concrete C 20/25 – $f_{ck,cube} = 25 \text{ N/mm}^2$.

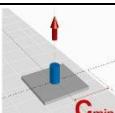

Recommended loads can be calculated by dividing the design resistance by an overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Design resistance

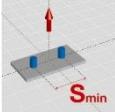

Single anchor, no edge effects, shear without lever arm

Anchor size		HMU-PF	Non-cracked concrete			Cracked concrete

				18

Setting instruction

For detailed information on installation see instruction for use given with the package of the product.

Setting details: depth of drill hole h_1 and effective anchorage depth h_{ef}

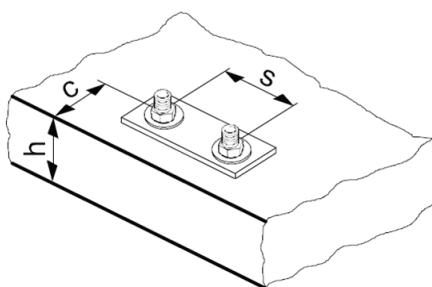

Setting details HSC-A (R)

Anchor version		M8x40	M10x40	M8x50	M12x60
Nominal diameter of drill bit	d_o [mm]	14	16	14	18
Cutting diameter of drill bit	$d_{cut} \leq$ [mm]	14,5	16,5	14,5	18,5
Depth of drill hole	$h_1 \geq$ [mm]	46	46	56	68
Diameter of clearance hole in the fixture	$d_f \leq$ [mm]	9	12	10	30
Effective anchorage depth	h_{ef} [mm]	40	40	50	60
Maximum fastening thickness	t_{fix} [mm]	15	20	15	20
Torque moment	T_{inst} [Nm]	10	20	10	30
Width across	SW [mm]	13	17	13	19

Base material thickness, anchor spacing and edge distance

Anchor size		M8x40	M10x40	M8x50	M12x60
Minimum base material thickness	h_{min} [mm]	100	100	100	130
Minimum spacing	s_{min} [mm]	40	40	50	60
Minimum edge distance	c_{min} [mm]	40	40	50	60
Critical spacing for concrete cone failure	$s_{cr,N}$ [mm]	120	120	150	180
Critical edge distance for concrete cone failure	$c_{cr,N}$ [mm]	60	60	75	90
Critical spacing for splitting failure	$s_{cr,sp}$ [mm]	130	120	170	180
Critical edge distance for splitting failure	$c_{cr,sp}$ [mm]	65	60	85	90

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced.

Critical spacing and critical edge distance for splitting failure apply only for non-cracked concrete. For cracked concrete only the critical spacing and critical edge distance for concrete cone failure are decisive.

Simplified design method

Simplified version of the design method according ETAG 001, Annex C. Design resistance according data given in ETA-02/0027 issue 2012-09-20.

- Influence of concrete strength
- Influence of edge distance
- Influence of spacing
- Valid for a group of two anchors. (The method may also be applied for anchor groups with more than two anchors or more than one edge. The influencing factors must then be considered for each edge distance and spacing. The calculated design loads are then on the safe side: They will be lower than the exact values according ETAG 001, Annex C. To avoid this, it is recommended to use the anchor design software PROFIS anchor)

The design method is based on the following simplification:

- No different loads are acting on individual anchors (no eccentricity)

The values are valid for one anchor.

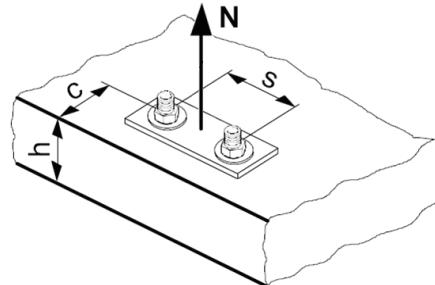

For more complex fastening applications please use the anchor design software PROFIS Anchor.

Tension loading

The design tensile resistance is the lower value of

- Steel resistance: $N_{Rd,s}$
- Concrete pull-out resistance: $N_{Rd,p} = N^0_{Rd,p} \cdot f_B$
- Concrete cone resistance: $N_{Rd,c} = N^0_{Rd,c} \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{re,N}$
- Concrete splitting resistance (only non-cracked concrete):

$$N_{Rd,sp} = N^0_{Rd,c} \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,sp} \cdot f_{re,N}$$

Basic design tensile resistance

Design steel resistance $N_{Rd,s}$

Anchor size		M8x40	M10x40	M8x50	M12x60
$N_{Rd,s}$	HSC-A [kN]	19,5	30,9	19,5	44,9
	HSC-AR [kN]	13,7	21,7	13,7	31,6

Design pull-out resistance $N_{Rd,p} = N^0_{Rd,p} \cdot f_B$ for HSC-A and HSC-AR

Anchor size	Non-cracked concrete				Cracked concrete			
	M8x40	M10x40	M8x50	M12x60	M8x40	M10x40	M8x50	M12x60
$N^0_{Rd,p}$ [kN]			No pull-out failure			No pull-out failure		

Design concrete cone resistance $N_{Rd,c} = N^0_{Rd,c} \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{re,N}$

Design splitting resistance ^{a)} $N_{Rd,sp} = N^0_{Rd,c} \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,sp} \cdot f_{re,N}$

Anchor size	Non-cracked concrete				Cracked concrete			
	M8x40	M10x40	M8x50	M12x60	M8x40	M10x40	M8x50	M12x60
$N^0_{Rd,c}$ [kN]	8,5	8,5	11,9	15,6	6,1	6,1	8,5	11,2

a) Splitting resistance must only be considered for non-cracked concrete

Influencing factors

Influence of concrete strength

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25N/mm^2)^{1/2}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of edge distance a)

c/c _{cr,N}	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
c/c _{cr,sp}										
$f_{1,N} = 0,7 + 0,3 \cdot c/c_{cr,N} \leq 1$	0,73	0,76	0,79	0,82	0,85	0,88	0,91	0,94	0,97	1
$f_{1,sp} = 0,7 + 0,3 \cdot c/c_{cr,sp} \leq 1$										
$f_{2,N} = 0,5 \cdot (1 + c/c_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{2,sp} = 0,5 \cdot (1 + c/c_{cr,sp}) \leq 1$										

a) The edge distance shall not be smaller than the minimum edge distance c_{min} given in the table with the setting details. These influencing factors must be considered for every edge distance.

Influence of anchor spacing a)

s/s _{cr,N}	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
s/s _{cr,sp}										
$f_{3,N} = 0,5 \cdot (1 + s/s_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{3,sp} = 0,5 \cdot (1 + s/s_{cr,sp}) \leq 1$										

a) The anchor spacing shall not be smaller than the minimum anchor spacing s_{min} given in the table with the setting details. This influencing factor must be considered for every anchor spacing.

Influence of base material thickness

h/h _{ef}	2,0	2,2	2,4	2,6	2,8	3,0	3,2	3,4	3,6	≥ 3,68
$f_{h,sp} = [h/(2 \cdot h_{ef})]^{2/3}$	1	1,07	1,13	1,19	1,25	1,31	1,37	1,42	1,48	1,5

Influence of reinforcement

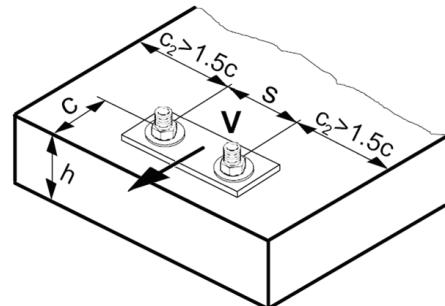

Anchor size	M8x40	M10x40	M8x50	M12x60
$f_{re,N} = 0,5 + h_{ef}/200mm \leq 1$	0,7 a)	0,7 a)	0,75 a)	0,8 a)

a) This factor applies only for dense reinforcement. If in the area of anchorage there is reinforcement with a spacing ≥ 150 mm (any diameter) or with a diameter ≤ 10 mm and a spacing ≥ 100 mm, then a factor $f_{re,N} = 1$ may be applied.

Shear loading

The design shear resistance is the lower value of

- Steel resistance: $V_{Rd,s}$
- Concrete prout resistance: $V_{Rd,cp} = k \cdot N_{Rd,c}$
- Concrete edge resistance: $V_{Rd,c} = V^0_{Rd,c} \cdot f_B \cdot f_\beta \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Basic design shear resistance

Design steel resistance $V_{Rd,s}$

Anchor size		M8x40	M10x40	M8x50	M12x60
$V_{Rd,s}$	HSC-A [kN]	11,7	18,6	11,7	27,0
	HSC-AR [kN]	8,2	13,0	8,2	18,9

Design concrete prout resistance $V_{Rd,cp} = k \cdot N_{Rd,c}$ ^{a)}

Anchor size	M8x40	M10x40	M8x50	M12x60
k			2,0	

a) $N_{Rd,c}$: Design concrete cone resistance

Design concrete edge resistance ^{a)} $V_{Rd,c} = V^0_{Rd,c} \cdot f_B \cdot f_\beta \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Anchor size	Non-cracked concrete				Cracked concrete			
	M8x40	M10x40	M8x50	M12x60	M8x40	M10x40	M8x50	M12x60
$V^0_{Rd,c}$ [kN]	14,9	18,5	15,0	22,7	10,5	13,1	10,6	16,1

a) For anchor groups only the anchors close to the edge must be considered.

Influencing factors

Influence of concrete strength

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25\text{N/mm}^2)^{1/2}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of angle between load applied and the direction perpendicular to the free edge

Angle β	0°	10°	20°	30°	40°	50°	60°	70°	80°	≥ 90°
$f_\beta = \sqrt{\frac{1}{(\cos \alpha_v)^2 + \left(\frac{\sin \alpha_v}{2,5}\right)^2}}$	1	1,01	1,05	1,13	1,24	1,40	1,64	1,97	2,32	2,50

Influence of base material thickness

h/c	0,15	0,3	0,45	0,6	0,75	0,9	1,05	1,2	1,35	≥ 1,5
$f_h = \{h/(1,5 \cdot c)\}^{1/2} \leq 1$	0,32	0,45	0,55	0,63	0,71	0,77	0,84	0,89	0,95	1,00

Influence of anchor spacing and edge distance ^{a)} for concrete edge resistance: f_4
 $f_4 = (c/h_{ef})^{1,5} \cdot (1 + s / [3 \cdot c]) \cdot 0,5$

c/h_{ef}	Single anchor	Group of two anchors s/h_{ef}														
		0,75	1,50	2,25	3,00	3,75	4,50	5,25	6,00	6,75	7,50	8,25	9,00	9,75	10,50	11,25

- a) The anchor spacing and the edge distance shall not be smaller than the minimum anchor spacing s_{min} and the minimum edge distance c_{min} .

Influence of embedment depth

Anchor size	M8x40	M10x40	M8x50	M12x60
$f_{hef} = 0,05 \cdot (h_{ef} / d)^{1,68}$	0,29	0,23	0,42	0,38

Influence of edge distance ^{a)}

c/d	4	6	8	10	15	20	30	40
$f_c = (d / c)^{0,19}$	0,77	0,71	0,67	0,65	0,60	0,57	0,52	0,50

- a) The edge distance shall not be smaller than the minimum edge distance c_{min} .

Combined tension and shear loading

For combined tension and shear loading see section "Anchor Design".

Precalculated values

Design resistance calculated according ETAG 001, Annex C and data given in ETA-02/0027, issue 2012-09-20.
All data applies to concrete C 20/25 – $f_{ck,cube} = 25 \text{ N/mm}^2$.

Recommended loads can be calculated by dividing the design resistance by an overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Design resistance

Single anchor, no edge effects

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Concrete as specified in the table
- Steel failure
- Minimum base material thickness
- Concrete C 20/25, $f_{ck,cube} = 25 \text{ N/mm}^2$

For details see Simplified design method

Mean ultimate resistance HSC-I and HSC-IR

Anchor size	Non-cracked concrete					Cracked concrete

Insert Tool	TE-C HSC-EW	14	16	18	20

Setting instruction

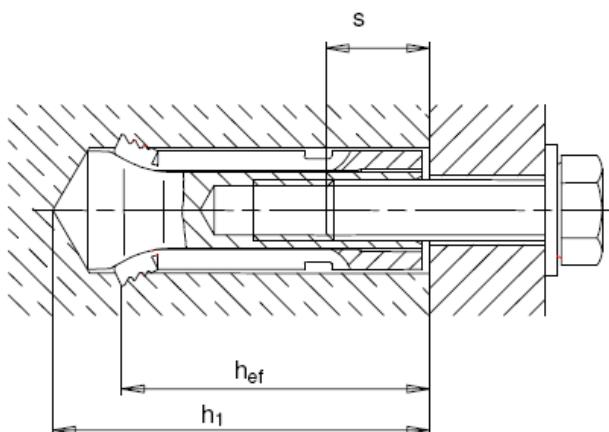

For HSC-I: fastening carbon steel screw or threaded rod. Minimum strength class 8.8

For HSC-IR: fastening stainless steel screw or threaded rod: minimum strength class A4-70

For detailed information on installation see instruction for use given with the package of the product.

Setting details: depth of drill hole h₁ and effective anchorage depth h_{ef}

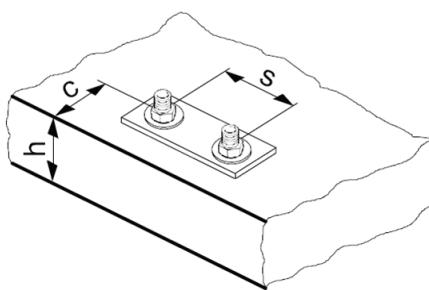

Setting details

Anchor version		M6x40	M8x40	M10x50	M10x60	M12x60
Nominal diameter of drill bit	d_0 [mm]	14	16	18	18	20
Cutting diameter of drill bit	$d_{cut} \leq$ [mm]	14,5	16,5	18,5	18,5	20,5
Depth of drill hole	$h_1 \geq$ [mm]	46	46	56	68	68
Diameter of clearance hole in the fixture	$d_f \leq$ [mm]	7	9	12	12	14
Effective anchorage depth	h_{ef} [mm]	40	40	50	60	60
Screwing depth	min s [mm]	6	8	10	10	12
	max s [mm]	16	22	28	28	30
Width across	SW [mm]	10	13	17	17	19
Installation torque	T_{inst} [Nm]	10	10	20	30	30

Base material thickness, anchor spacing and edge distance

Anchor size		M6x40	M8x40	M10x50	M10x60	M12x60
Minimum base material thickness	h_{min} [mm]	100	100	110	130	130
Minimum spacing	s_{min} [mm]	40	40	50	60	60
Minimum edge distance	c_{min} [mm]	40	40	50	60	60
Critical spacing for concrete cone failure	$s_{cr,N}$ [mm]	120	120	150	180	180
Critical edge distance for concrete cone failure	$c_{cr,N}$ [mm]	60	60	75	90	90
Critical spacing for splitting failure	$s_{cr,sp}$ [mm]	130	120	170	180	180
Critical edge distance for splitting failure	$c_{cr,sp}$ [mm]	65	60	85	90	90

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced.

Critical spacing and critical edge distance for splitting failure apply only for non-cracked concrete. For cracked concrete only the critical spacing and critical edge distance for concrete cone failure are decisive.

Simplified design method

Simplified version of the design method according ETAG 001, Annex C. Design resistance according data given in ETA-02/0027 issue 2012-09-20.

- Influence of concrete strength
- Influence of edge distance
- Influence of spacing
- Valid for a group of two anchors. (The method may also be applied for anchor groups with more than two anchors or more than one edge. The influencing factors must then be considered for each edge distance and spacing. The calculated design loads are then on the safe side: They will be lower than the exact values according ETAG 001, Annex C. To avoid this, it is recommended to use the anchor design software PROFIS anchor)

The design method is based on the following simplification:

- No different loads are acting on individual anchors (no eccentricity)

The values are valid for one anchor.

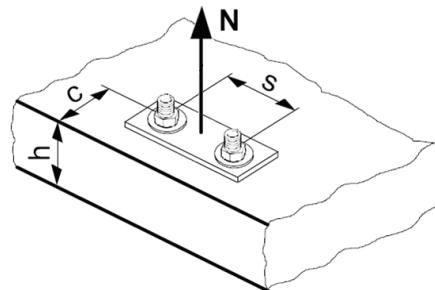

For more complex fastening applications please use the anchor design software PROFIS Anchor.

Tension loading

The design tensile resistance is the lower value of

- Steel resistance: $N_{Rd,s}$
- Concrete pull-out resistance: $N_{Rd,p}^0 = N_{Rd,p}^0 \cdot f_B$
- Concrete cone resistance: $N_{Rd,c}^0 = N_{Rd,c}^0 \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{re,N}$
- Concrete splitting resistance (only non-cracked concrete):

$$N_{Rd,sp} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,sp} \cdot f_{re,N}$$

Basic design tensile resistance

Design steel resistance $N_{Rd,s}$

Anchor size		M6x40	M8x40	M10x50	M10x60	M12x60
$N_{Rd,s}$	HSC-I [kN]	10,7	16,3	20,2	20,2	24,3
	HSC-IR [kN]	7,5	11,4	14,2	14,2	17,1

Design pull-out resistance $N_{Rd,p} = N_{Rd,p}^0 \cdot f_B$

Anchor size	Non-cracked concrete					Cracked concrete				
	M6x40	M8x40	M10x50	M10x60	M12x60	M6x40	M8x40	M10x50	M10x60	M12x60
$N_{Rd,p}^0$ [kN]	No pull-out failure					No pull-out failure				

Design concrete cone resistance $N_{Rd,c} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{re,N}$

Design splitting resistance ^{a)} $N_{Rd,sp} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,sp} \cdot f_{re,N}$

Anchor size	Non-cracked concrete					Cracked concrete				
	M6x40	M8x40	M10x50	M10x60	M12x60	M6x40	M8x40	M10x50	M10x60	M12x60
$N_{Rd,c}^0$ [kN]	8,5	8,5	11,9	15,6	15,6	6,1	6,1	8,5	11,2	11,2

- Splitting resistance must only be considered for non-cracked concrete

Influencing factors

Influence of concrete strength

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25N/mm^2)^{1/2}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

- $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of edge distance a)

c/c _{cr,N}	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
c/c _{cr,sp}										
$f_{1,N} = 0,7 + 0,3 \cdot c/c_{cr,N} \leq 1$	0,73	0,76	0,79	0,82	0,85	0,88	0,91	0,94	0,97	1
$f_{1,sp} = 0,7 + 0,3 \cdot c/c_{cr,sp} \leq 1$										
$f_{2,N} = 0,5 \cdot (1 + c/c_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{2,sp} = 0,5 \cdot (1 + c/c_{cr,sp}) \leq 1$										

- The edge distance shall not be smaller than the minimum edge distance c_{min} given in the table with the setting details. These influencing factors must be considered for every edge distance.

Influence of anchor spacing a)

s/s _{cr,N}	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
s/s _{cr,sp}										
$f_{3,N} = 0,5 \cdot (1 + s/s_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{3,sp} = 0,5 \cdot (1 + s/s_{cr,sp}) \leq 1$										

- The anchor spacing shall not be smaller than the minimum anchor spacing s_{min} given in the table with the setting details. This influencing factor must be considered for every anchor spacing.

Influence of base material thickness

h/h _{ef}	2,0	2,2	2,4	2,6	2,8	3,0	3,2	3,4	3,6	≥ 3,68
$f_{h,sp} = [h/(2 \cdot h_{ef})]^{2/3}$	1	1,07	1,13	1,19	1,25	1,31	1,37	1,42	1,48	1,5

Influence of reinforcement

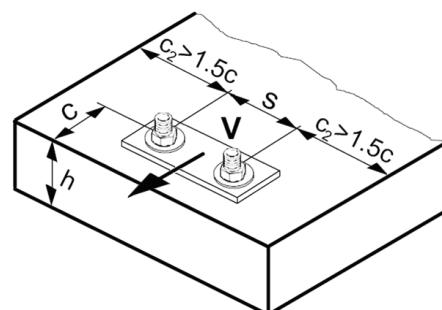

Anchor size	M6x40	M8x40	M10x50	M10x60	M12x60
$f_{re,N} = 0,5 + h_{ef}/200mm \leq 1$	0,7 a)	0,7 a)	0,75 a)	0,8 a)	0,8 a)

- This factor applies only for dense reinforcement. If in the area of anchorage there is reinforcement with a spacing ≥ 150 mm (any diameter) or with a diameter ≤ 10 mm and a spacing ≥ 100 mm, then a factor $f_{re,N} = 1$ may be applied.

Shear loading

The design shear resistance is the lower value of

- Steel resistance: $V_{Rd,s}$
- Concrete prout resistance: $V_{Rd,cp} = k \cdot N_{Rd,c}$
- Concrete edge resistance: $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_B \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Basic design shear resistance

Design steel resistance $V_{Rd,s}$

Anchor size		M6x40	M8x40	M10x50	M10x60	M12x60
$V_{Rd,s}$	HSC-I [kN]	6,4	9,8	12,2	12,2	14,6
	HSC-IR [kN]	4,5	6,9	8,5	8,5	10,3

Design concrete prerot resistance $V_{Rd,cp} = k \cdot N_{Rd,c}$ ^{a)}

Anchor size	M6x40	M8x40	M10x50	M10x60	M12x60
k			2,0		

a) $N_{Rd,c}$: Design concrete cone resistance

Design concrete edge resistance ^{a)} $V_{Rd,c}^0 = V_{Rd,c}^0 \cdot f_B \cdot f_\beta \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Anchor size	Non-cracked concrete					Cracked concrete				
	M6x40	M8x40	M10x50	M10x60	M12x60	M6x40	M8x40	M10x50	M10x60	M12x60
$V_{Rd,c}^0$ [kN]	14,9	18,5	22,6	22,7	27,0	10,5	13,1	16,0	16,1	19,1

- For anchor groups only the anchors close to the edge must be considered.

Influencing factors

Influence of concrete strength

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25\text{N/mm}^2)^{1/2}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

- $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of angle between load applied and the direction perpendicular to the free edge

Angle β	0°	10°	20°	30°	40°	50°	60°	70°	80°	≥ 90°
$f_\beta = \sqrt{\frac{1}{(\cos \alpha_v)^2 + \left(\frac{\sin \alpha_v}{2,5}\right)^2}}$	1	1,01	1,05	1,13	1,24	1,40	1,64	1,97	2,32	2,50

Influence of base material thickness

h/c	0,15	0,3	0,45	0,6	0,75	0,9	1,05	1,2	1,35	≥ 1,5
$f_h = \{h/(1,5 \cdot c)\}^{1/2} \leq 1$	0,32	0,45	0,55	0,63	0,71	0,77	0,84	0,89	0,95	1,00

Influence of anchor spacing and edge distance ^{a)} for concrete edge resistance: f_4
 $f_4 = (c/h_{ef})^{1,5} \cdot (1 + s / [3 \cdot c]) \cdot 0,5$

c/h _{ef}	Single anchor	Group of two anchors s/h _{ef}														
		0,75	1,50	2,25	3,00	3,75	4,50	5,25	6,00	6,75	7,50	8,25	9,00	9,75	10,50	11,25
0,50	0,35	0,27	0,35	0,35	0,35	0,35	0,35	0,35	0,35	0,35	0,35	0,35	0,35	0,35	0,35	0,35

- The anchor spacing and the edge distance shall not be smaller than the minimum anchor spacing s_{min} and the minimum edge distance c_{min} .

Influence of embedment depth

Anchor size	M6x40	M8x40	M10x50	M10x60	M12x60
$f_{hef} = 0,05 \cdot (h_{ef} / d)^{1,68}$	0,29	0,23	0,28	0,38	0,32

Influence of edge distance ^{a)}

c/d	4	6	8	10	15	20	30	40
$f_c = (d / c)^{0,19}$	0,77	0,71	0,67	0,65	0,60	0,57	0,52	0,50

a) The edge distance shall not be smaller than the minimum edge distance c_{min} .

Combined tension and shear loading

For combined tension and shear loading see section "Anchor Design".

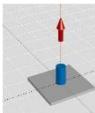

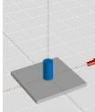

Precalculated values

Design resistance calculated according ETAG 001, Annex C and data given in ETA-02/0027, issue 2012-09-20. All data applies to concrete C 20/25 – $f_{ck,cube} = 25 \text{ N/mm}^2$.

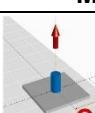

Recommended loads can be calculated by dividing the design resistance by an overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Design resistance

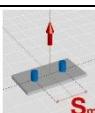

Single anchor, no edge effects

Anchor size		Non-cracked concrete					Cracked concrete

a) All data given in this section according ETA-98/0001, issue 2013-05-08.

Basic loading data (for a single anchor)

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Concrete as specified in the table
- **Steel failure**
- Minimum base material thickness
- Concrete C 20/25, $f_{ck,cube} = 25 \text{ N/mm}^2$

For details see Simplified design method

Width across	SW [mm]	13	17	19	24	30	36

Setting parameters

Anchor size			M8	M10	M12	M16	M20	M24	
Minimum base material thickness	h_{\min}	[mm]	100	120	140	160	200	250	
Minimum spacing in non-cracked concrete	HST	s_{\min}	[mm]	60	55	60	70	100	125
		for $c \geq$	[mm]	50	80	85	110	225	255
	HST-R	s_{\min}	[mm]	60	55	60	70	100	125
		for $c \geq$	[mm]	60	70	80	110	195	205
Minimum spacing in cracked concrete	HST-HCR	s_{\min}	[mm]	60	55	60	70	-	-
		for $c \geq$	[mm]	50	70	80	110	-	-
	HST	s_{\min}	[mm]	40	55	60	70	100	125
		for $c \geq$	[mm]	50	70	75	100	160	180
Minimum edge distance in non-cracked concrete	HST-R	c_{\min}	[mm]	60	50	55	70	100	125
		for $s \geq$	[mm]	60	115	145	150	270	295
	HST-HCR	c_{\min}	[mm]	60	55	55	70	-	-
		for $s \geq$	[mm]	60	115	145	160	-	-
Minimum edge distance in cracked concrete	HST	c_{\min}	[mm]	45	55	55	70	100	125
		for $s \geq$	[mm]	50	90	120	150	225	240
	HST-R	c_{\min}	[mm]	45	50	55	60	100	125
		for $s \geq$	[mm]	50	90	110	160	160	140
Critical spacing for splitting failure and concrete cone failure	$s_{cr,sp}$ $s_{cr,N}$	[mm]	141	180	210	246	303	375	
Critical edge distance for splitting failure and concrete cone failure	$c_{cr,sp}$ $c_{cr,N}$	[mm]	71	90	105	123	152	188	

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced.

Simplified design method

Simplified version of the design method according ETAG 001, Annex C. Design resistance according data given in ETA-98/0001, issue 2013-05-08.

- Influence of concrete strength
- Influence of edge distance
- Influence of spacing
- Valid for a group of two anchors. (The method may also be applied for anchor groups with more than two anchors or more than one edge. The influencing factors must then be considered for each edge distance and spacing. The calculated design loads are then on the safe side: They will be lower than the exact values according ETAG 001, Annex C. To avoid this, it is recommended to use the anchor design software PROFIS anchor)

The design method is based on the following simplification:

- No different loads are acting on individual anchors (no eccentricity)

The values are valid for one anchor.

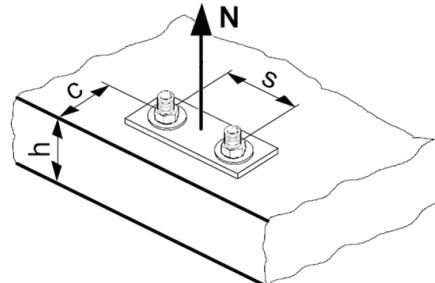

For more complex fastening applications please use the anchor design software PROFIS Anchor.

Tension loading

The design tensile resistance is the lower value of

- Steel resistance: $N_{Rd,s}$
- Concrete pull-out resistance: $N_{Rd,p} = N^0_{Rd,p} \cdot f_B$
- Concrete cone resistance: $N_{Rd,c} = N^0_{Rd,c} \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{re,N}$
- Concrete splitting resistance (only non-cracked concrete):

$$N_{Rd,sp} = N^0_{Rd,c} \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,sp} \cdot f_{re,N}$$

Basic design tensile resistance

Design steel resistance $N_{Rd,s}$

Anchor size	M8	M10	M12	M16	M20	M24
$N_{Rd,s}$	HST [kN]	12,7	21,3	30,0	50,7	78,0
	HST-R [kN]	11,3	18,7	26,7	44,2	63,0
	HST-HCR [kN]	12,9	21,5	30,5	56,3	-

Design pull-out resistance $N_{Rd,p} = N^0_{Rd,p} \cdot f_B$

Anchor size	Non-cracked concrete						Cracked concrete					
	M8	M10	M12	M16	M20	M24	M8	M10	M12	M16	M20	M24
$N^0_{Rd,p}$	HST [kN]	5,0	10,7	13,3	23,3	33,3	40,0	2,8	6,0	8,0	13,3	20,0
	HST-R [kN]	6,0	10,7	13,3	23,3	33,3	40,0	3,3	6,0	8,0	16,7	20,0
	HST-HCR [kN]	6,0	10,7	13,3	23,3	-	-	3,3	6,0	8,0	16,7	-

Design concrete cone resistance $N_{Rd,c} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{re,N}$

Design splitting resistance ^{a)} $N_{Rd,sp} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,sp} \cdot f_{re,N}$

		Non-cracked concrete						Cracked concrete					
Anchor size		M8	M10	M12	M16	M20	M24	M8	M10	M12	M16	M20	M24
$N_{Rd,c}^0$	HST [kN]	9,0	15,6	19,7	24,9	34,1	47	6,4	11,2	14,1	17,8	24,4	33,5

	HST-HCR [kN]	10,8	15,6	19,7	24,9	-	-	7,7	11,2	14,1	17,8	-	-

a) Splitting resistance must only be considered for non-cracked concrete

Influencing factors

Influence of concrete strength

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25\text{N/mm}^2)^{1/2}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of edge distance ^{a)}

$c/c_{cr,N}$	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$c/c_{cr,sp}$										
$f_{1,N} = 0,7 + 0,3 \cdot c/c_{cr,N} \leq 1$	0,73	0,76	0,79	0,82	0,85	0,88	0,91	0,94	0,97	1
$f_{1,sp} = 0,7 + 0,3 \cdot c/c_{cr,sp} \leq 1$										
$f_{2,N} = 0,5 \cdot (1 + c/c_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{2,sp} = 0,5 \cdot (1 + c/c_{cr,sp}) \leq 1$										

a) The edge distance shall not be smaller than the minimum edge distance c_{min} given in the table with the setting details. These influencing factors must be considered for every edge distance.

Influence of anchor spacing ^{a)}

$s/s_{cr,N}$	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$s/s_{cr,sp}$										
$f_{3,N} = 0,5 \cdot (1 + s/s_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{3,sp} = 0,5 \cdot (1 + s/s_{cr,sp}) \leq 1$										

a) The anchor spacing shall not be smaller than the minimum anchor spacing s_{min} given in the table with the setting details. This influencing factor must be considered for every anchor spacing.

Influence of base material thickness

h/h_{ef}	2,0	2,2	2,4	2,6	2,8	3,0	3,2	3,4	3,6	$\geq 3,68$
$f_{h,sp} = [h/(2 \cdot h_{ef})]^{2/3}$	1	1,07	1,13	1,19	1,25	1,31	1,37	1,42	1,48	1,5

Influence of reinforcement

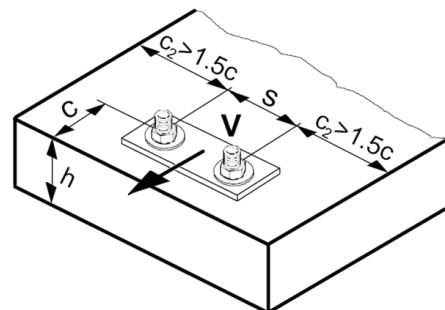

Anchor size	M8	M10	M12	M16	M20	M24
$f_{re,N} = 0,5 + h_{ef}/200\text{mm} \leq 1$	0,74 ^{a)}	0,8 ^{a)}	0,85 ^{a)}	0,91 ^{a)}	1	1

a) This factor applies only for dense reinforcement. If in the area of anchorage there is reinforcement with a spacing ≥ 150 mm (any diameter) or with a diameter ≤ 10 mm and a spacing ≥ 100 mm, then a factor $f_{re,N} = 1$ may be applied.

Shear loading

The design shear resistance is the lower value of

- Steel resistance: $V_{Rd,s}$
- Concrete prout resistance: $V_{Rd,cp} = k \cdot N_{Rd,c}$
- Concrete edge resistance: $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_\beta \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Basic design shear resistance

Design steel resistance $V_{Rd,s}$

Anchor size	M8	M10	M12	M16	M20	M24
$V_{Rd,s}$	HST [kN]	11,2	18,8	28,0	44,0	67,2
	HST-R [kN]	10,4	16,0	24,0	38,5	55,6
	HST-HCR [kN]	10,4	16,0	24,0	44,0	-

Design concrete prout resistance $V_{Rd,cp} = k \cdot N_{Rd,c}$ ^{a)}

Anchor size	M8	M10	M12	M16	M20	M24
k	2	2	2,2	2,5	2,5	2,5

a) $N_{Rd,c}$: Design concrete cone resistance

Design concrete edge resistance ^{a)} $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_\beta \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Anchor size	Non-cracked concrete						Cracked concrete					
	M8	M10	M12	M16	M20	M24	M8	M10	M12	M16	M20	M24
$V_{Rd,c}^0$ [kN]	5,9	8,6	11,7	18,9	27,3	37,1	4,2	6,1	8,3	13,4	19,3	26,3

a) For anchor groups only the anchors close to the edge must be considered.

Influencing factors

Influence of concrete strength

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25\text{ N/mm}^2)^{1/2}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of angle between load applied and the direction perpendicular to the free edge

Angle β	0°	10°	20°	30°	40°	50°	60°	70°	80°	≥ 90°
$f_\beta = \sqrt{\frac{1}{(\cos \alpha_v)^2 + \left(\frac{\sin \alpha_v}{2,5}\right)^2}}$	1	1,01	1,05	1,13	1,24	1,40	1,64	1,97	2,32	2,50

Influence of base material thickness

h/c	0,15	0,3	0,45	0,6	0,75	0,9	1,05	1,2	1,35	≥ 1,5
$f_h = \{h/(1,5 \cdot c)\}^{1/2} \leq 1$	0,32	0,45	0,55	0,63	0,71	0,77	0,84	0,89	0,95	1,00

Influence of anchor spacing and edge distance ^{a)} for concrete edge resistance: f_4

$$f_4 = (c/h_{ef})^{1,5} \cdot (1 + s / [3 \cdot c]) \cdot 0,5$$

c/h _{ef}	Single anchor	Group of two anchors s/h _{ef}														
		0,75	1,50	2,25	3,00	3,75	4,50	5,25	6,00	6,75	7,50	8,25	9,00	9,75	10,50	11,25
0,50	0,35	0,27	0,35	0,35	0,35	0,35	0,35	0,35	0,35	0,35	0,35	0,35	0,35	0,35	0,35	0,35
0,75	0,65	0,43	0,54	0,65	0,65	0,65	0,65	0,65	0,65	0,65	0,65	0,65	0,65	0,65	0,65	0,65
1,00	1,00	0,63	0,75	0,88	1,00	1,00	1,00	1,00	1,00	1,00	1,00	1,00	1,00	1,00	1,00	1,00
1,25	1,40	0,84	0,98	1,12	1,26	1,40	1,40	1,40	1,40	1,40	1,40	1,40	1,40	1,40	1,40	1,40
1,50	1,84	1,07	1,22	1,38	1,53	1,68	1,84	1,84	1,84	1,84	1,84	1,84	1,84	1,84	1,84	1,84

4,00	8,00	4,25	4,50	4,75	5,00	5,25	5,50	5,75	6,00	6,25	6,50	6,75	7,00	7,25	7,50	7,75
4,25	8,76	4,64	4,90	5,15	5,41	5,67	5,93	6,18	6,44	6,70	6,96	7,22	7,47	7,73	7,99	8,25
4,50	9,55	5,04	5,30	5,57	5,83	6,10	6,36	6,63	6,89	7,16	7,42	7,69	7,95	8,22	8,49	8,75
4,75	10,35	5,45	5,72	5,99	6,27	6,54	6,81	7,08	7,36	7,63	7,90	8,17	8,45	8,72	8,99	9,26
5,00	11,18	5,87	6,15	6,43	6,71	6,99	7,27	7,55	7,83	8,11	8,39	8,66	8,94	9,22	9,50	9,78
5,25	12,03	6,30	6,59	6,87	7,16	7,45	7,73	8,02	8,31	8,59	8,88	9,17	9,45	9,74	10,02	10,31
5,50	12,90	6,74	7,04	7,33	7,62	7,92	8,21	8,50	8,79	9,09	9,38	9,67	9,97	10,26	10,55	10,85

a) The anchor spacing and the edge distance shall not be smaller than the minimum anchor spacing s_{min} and the minimum edge distance c_{min} .

Influence of embedment depth

Anchor size	M8	M10	M12	M16	M20	M24
$f_{hef} = 0,05 \cdot (h_{ef} / d)^{1,68}$	0,98	1,01	0,97	0,78	0,76	0,80

Influence of edge distance ^{a)}

c/d	4	6	8	10	15	20	30	40
$f_c = (d / c)^{0,19}$	0,77	0,71	0,67	0,65	0,60	0,57	0,52	0,50

a) The edge distance shall not be smaller than the minimum edge distance c_{min} .

Combined tension and shear loading

For combined tension and shear loading see section "Anchor Design".

Precalculated values

Design resistance calculated according ETAG 001, Annex C and data given in ETA-98/0001, issue 2013-05-08. All data applies to concrete C 20/25 – $f_{ck,cube} = 25 \text{ N/mm}^2$.

Recommended loads can be calculated by dividing the design resistance by an overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Design resistance

Single anchor, no edge effects

		Non-cracked concrete						Cracked concrete						
Anchor size		M8	M10	M12	M16	M20	M24	M8	M10	M12	M16	M20	M24

Seismic design C1 and C2

Basic loading data for concrete C20/25 – C50/60

All data in this section applies to:

- Seismic design according to TR045

The following technical data are based on: ETA-98/0001 issue 2013-05-08

Anchorage depth range

Anchor size	M8	M10	M12	M16	M20	M24
Nominal anchorage depth range h_{nom} [mm]	55	69	80	95	117	143

Tension resistance in case of seismic performance category C1

Anchor size	M10	M12	M16
Characteristic tension resistance to steel failure			
HST (steel galvanized)			
Characteristic resistance $N_{Rk,s,\text{seis}}$ [kN]	32	45	76
Partial safety factor $\gamma_{Ms,\text{seis}}$ [-]		1,5	
HST-R (stainless steel)			
Characteristic resistance $N_{Rk,s,\text{seis}}$ [kN]	28	40	69
Partial safety factor $\gamma_{Ms,\text{seis}}$ [-]		1,5	1,56
Pullout failure			
HST (steel galvanized) and HST-R (stainless steel)			
Characteristic resistance $N_{Rk,p,\text{seis}}$ [kN]	8,0	10,7	18,0
Partial safety factor $\gamma_{Mp,\text{seis}}$ [-]		1,5	
Concrete cone and splitting failure			
HST (steel galvanized) and HST-R (stainless steel)			
Partial safety factor $\gamma_{Mc,\text{seis}} = \gamma_{Msp,\text{seis}}$ [-]		1,5	

Displacement under tension load in case of seismic performance category C1¹⁾

Anchor size	M10	M12	M16
Displacement HST and HST-R $\delta_{N,\text{seis}}$ [mm]	1,1	0,8	1,0

1) Maximum displacement during cycling (seismic event).

Shear resistance in case of seismic performance category C1¹⁾

Anchor size	M10	M12	M16
Steel failure			
HST (steel galvanized)			
Characteristic resistance V _{Rk,s,seis} [kN]	16	27	41,3
Partial safety factor γ _{Ms,seis} [-]		1,25	
HST-R (stainless steel)			
Characteristic resistance V _{Rk,s,seis} [kN]	13,6	23,1	37,5
Partial safety factor γ _{Ms,seis} [-]		1,25	1,3
Concrete pryout and concrete edge failure			
HST (steel galvanized) and HST-R (stainless steel)			
Partial safety factor γ _{Mcp,seis} = γ _{Mc,seis} [-]		1,5	

1) Reduction factor α_{gap} = 1,0 when using the Hilti Dynamic Set

Displacement under shear load for seismic loading, performance category C1¹⁾

Anchor size	M10	M12	M16
Displacement HST and HST-R δ _{V,seis} [mm]	6,2	7,3	6,2

1) Maximum displacement during cycling (seismic event).

For seismic resistant fastening applications please use the anchor design software PROFIS Anchor.

Tension resistance in case of seismic performance category C2

Anchor size	M10	M12	M16
Characteristic tension resistance to steel failure			
HST (steel galvanized)			
Characteristic resistance $N_{Rk,s,seis}$ [kN]	32	45	76
Partial safety factor $\gamma_{Ms,seis}$ [-]		1,5	
HST-R (stainless steel)			
Characteristic resistance $N_{Rk,s,seis}$ [kN]	28	40	69
Partial safety factor $\gamma_{Ms,seis}$ [-]		1,5	1,56
Pullout failure			
HST (steel galvanized) and HST-R (stainless steel)			
Characteristic resistance $N_{Rk,p,seis}$ [kN]	3,3	10,0	12,8
Partial safety factor $\gamma_{Ms,seis}$ [-]		1,5	
Concrete cone and splitting failure			
HST (steel galvanized) and HST-R (stainless steel)			
Partial safety factor $\gamma_{Mc,seis} = \gamma_{Msp,seis}$ [-]		1,5	

Displacement under tension load in case of seismic performance category C2

Anchor size	M10	M12	M16
HST and HST-R			
Displacement DLS $\delta_{N,seis(DLS)}$ [mm]	1,4	6,7	4,0
Displacement ULS $\delta_{N,seis(ULS)}$ [mm]	8,6	15,9	13,3

Shear resistance in case of seismic performance category C2¹⁾

Anchor size	M10	M12	M16
Steel failure			
HST (steel galvanized)			
Characteristic resistance V _{Rk,s,seis} [kN]	14,3	21	41,3
Partial safety factor γ _{Ms,seis} [-]		1,25	
HST-R (stainless steel)			
Characteristic resistance V _{Rk,s,seis} [kN]	12	18	37,5
Partial safety factor γ _{Ms,seis} [-]		1,25	1,3
Concrete pryout and concrete edge failure			
HST (steel galvanized) and HST-R (stainless steel)			
Partial safety factor γ _{Mcp,seis = Mc,seis} [-]		1,5	

1) Reduction factor $\alpha_{gap} = 1,0$ when using the Hilti Dynamic Set

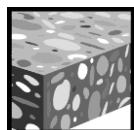

Displacement under shear load in case of seismic performance category C2

Anchor size	M10	M12	M16
HST and HST-R			
Displacement DLS δ _{V,seis(DLS)} [mm]	4,2	5,3	5,7
Displacement ULS δ _{V,seis(DLS)} [mm]	7,5	7,9	8,9

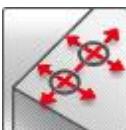

For seismic resistant fastening applications please use the anchor design software PROFIS Anchor.

HSA Stud anchor

Anchor version	Benefits
	<p>HSA Carbon steel with DIN 125 washer</p> <ul style="list-style-type: none"> - Fast & convenient setting behaviour - Reliable ETA approved torqueing using impact wrench with torque bar for torque control - Small edge and spacing distances - High loads - Three embedment depths for maximal design flexibility - M12, M16 and M20 ETA approved for diamond cored holes using DD 30-W and matching diamond core bit - Suitable for pre- and through fastening
	<p>HSA-R Stainless steel A4 HSA-R2 Stainless steel A2 with DIN 125 washer</p>
	<p>HSA-BW Carbon steel with DIN 9021 washer</p>

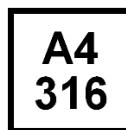

Concrete

Small edge distance and spacing

Fire resistance

Corrosion resistance

Diamond drilled holes

European Technical Approval

CE conformity

PROFIS Anchor design software

Approvals / certificates

Description	Authority / Laboratory	No. / date of issue
European technical approval ^{a)}	DIBt, Berlin	ETA-11/0374 / 2012-07-19
Fire test report	IBMB, Braunschweig	3215/229/12 / 2012-08-09

a) All data given in this section according ETA-11/0374, issue 2012-07-19.

Basic loading data (for a single anchor)

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Steel failure
- Minimum base material thickness
- Non-cracked Concrete C 20/25, $f_{ck,cube} = 25 \text{ N/mm}^2$

For details see Simplified design method

Anchor length in bolt type and grey shaded are standard items. For selection of other anchor length, check availability of the items.

Setting**Installation equipment**

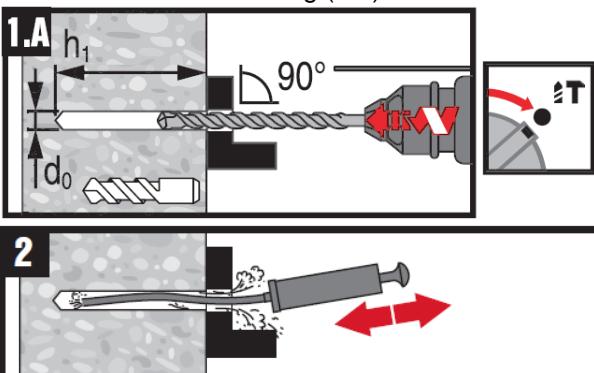

Anchor size	M6	M8	M10	M12	M16	M20
Rotary hammer			TE2 – TE16			TE40 – TE70
Other tools			hammer, torque wrench, blow out pump			

Setting instruction

Drill and clean borehole

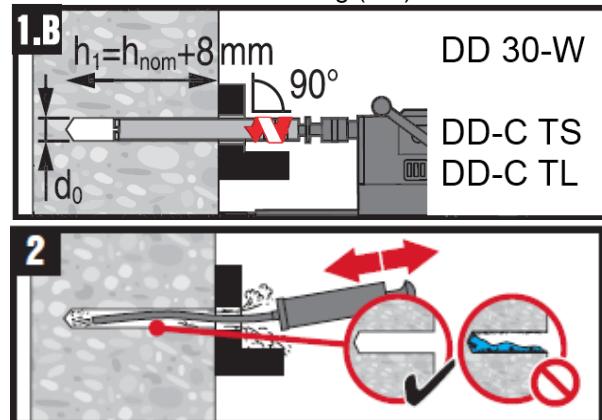

Standard drilling method

M6 – M20: Hammer drilling (HD)

Alternative drilling method

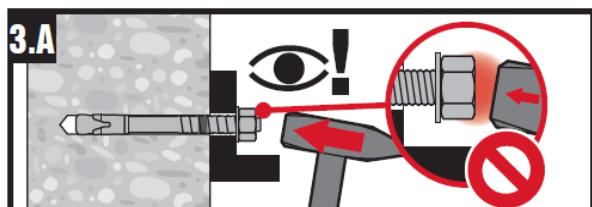

M12 – M20: Diamond drilling (DD)

Install anchor with hammer or machine setting tool

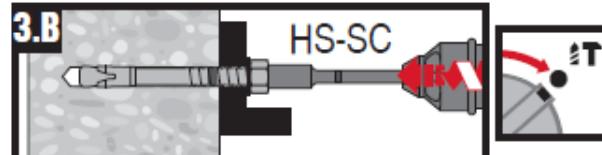

Standard setting method

M6 – M20: Hammer setting

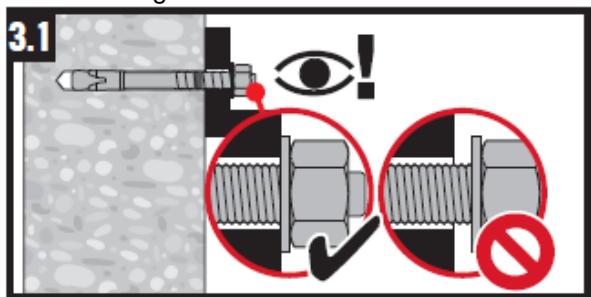

Alternative setting method

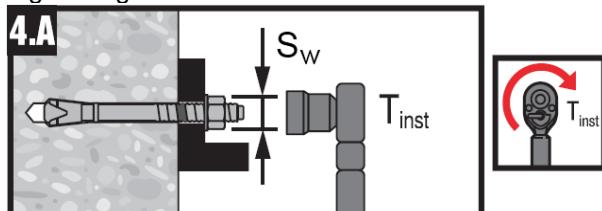

M8 – M16: Machine setting

Check setting

Tightening the anchor

For detailed information on installation see instruction for use given with the package of the product.

Machine tightening of the anchor for standard installation torque

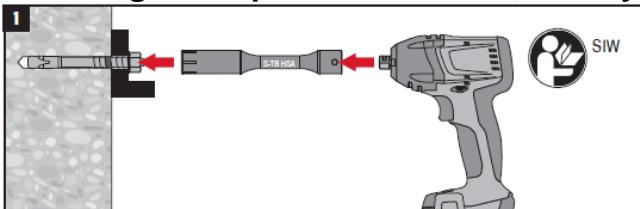

Type	HSA, HSA-BW, HSA-R2, HSA-R

Critical spacing for concrete cone failure $s_{\text{cr,N}}$ [mm]	150	195	300	195	240	360	225	300	345
Critical edge distance for concrete cone failure $c_{\text{cr,N}}$ [mm]	75	97,5	150	97,5	120	180	112,5	150	172,5

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced.

Simplified design method

Simplified version of the design method according ETAG 001, Annex C. Design resistance according ETA-11/0374, issue 2012-07-19.

- Influence of concrete strength
- Influence of edge distance
- Influence of spacing
- Valid for a group of two anchors. (The method may also be applied for anchor groups with more than two anchors or more than one edge. The influencing factors must then be considered for each edge distance and spacing. The calculated design loads are then conservative: They will be lower than the exact values according ETAG 001, Annex C. To avoid this, it is recommended to use the anchor design software PROFIS anchor)

The design method is based on the following simplification:

- No different loads are acting on individual anchors (no eccentricity)

The values are valid for one anchor.

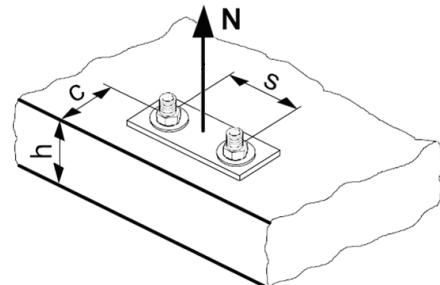

For more complex fastening applications please use the anchor design software PROFIS Anchor.

Tension loading

The design tensile resistance is the lower value of

- Steel resistance: $N_{Rd,s}$
- Concrete pull-out resistance: $N_{Rd,p} = N_{Rd,p}^0 \cdot f_B$
- Concrete cone resistance: $N_{Rd,c} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{re,N}$
- Concrete splitting resistance (only non-cracked concrete):

$$N_{Rd,sp} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,sp} \cdot f_{re,N}$$

Basic design tensile resistance

Design steel resistance $N_{Rd,s}$

Anchor size	M6	M8	M10	M12	M16	M20
$N_{Rd,s}$	HSA, HSA-BW [kN]	6,4	11,8	20,0	29,6	59,0
	HSA-R2, HSA-R [kN]	8,7	13,1	25,0	31,9	68,5

Design pull-out resistance $N_{Rd,p} = N_{Rd,p}^0 \cdot f_B$

Anchor size	M6			M8			M10		
Effective anchorage depth h_{ef} [mm]	30	40	60	30	40	70	40	50	80
$N_{Rd,p}^0$ HSA, HSA-BW, HSA-R2, HSA-R [kN]	4,0	5,0	6,0	No pull-out		10,7	No pull-out		16,7

Anchor size	M12			M16			M20		
Effective anchorage depth h_{ef} [mm]	50	65	100	65	80	120	75	100	115
$N_{Rd,p}^0$ HSA, HSA-BW, HSA-R2, HSA-R [kN]	No pull-out		23,3	No pull-out		33,3	No pull-out		

Design concrete cone resistance $N_{Rd,c} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{re,N}$
Design splitting resistance ^{a)} $N_{Rd,sp} = N_{Rd,sp}^0 \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,sp} \cdot f_{re,N}$

Anchor size	M6			M8			M10		
Effective anchorage depth h_{ef} [mm]	30	40	60	30	40	70	40	50	80

$N_{Rd,p}^0$ HSA, HSA-BW, HSA-R2, HSA-R [kN]	11,9	17,6	33,7	17,6	24,1	44,3	21,9	33,7	41,5

Influencing factors

Influence of concrete strength

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
Pull-out, concrete cone and splitting resistance							
$f_B = (f_{ck,cube}/25\text{N/mm}^2)^{1/2}$ ^{a)}	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of edge distance ^{a)}

$c/c_{cr,N}$	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$c/c_{cr,sp}$										
$f_{1,N} = 0,7 + 0,3 \cdot c/c_{cr,N} \leq 1$	0,73	0,76	0,79	0,82	0,85	0,88	0,91	0,94	0,97	1
$f_{1,sp} = 0,7 + 0,3 \cdot c/c_{cr,sp} \leq 1$										
$f_{2,N} = 0,5 \cdot (1 + c/c_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{2,sp} = 0,5 \cdot (1 + c/c_{cr,sp}) \leq 1$										

a) The edge distance shall not be smaller than the minimum edge distance c_{min} given in the table with the setting details. These influencing factors must be considered for every edge distance.

Influence of anchor spacing ^{a)}

$s/s_{cr,N}$	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$f_{3,N} = 0,5 \cdot (1 + s/s_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{3,sp} = 0,5 \cdot (1 + s/s_{cr,sp}) \leq 1$										

- a) The anchor spacing shall not be smaller than the minimum anchor spacing s_{min} given in the table with the setting details. This influencing factor must be considered for every anchor spacing.

Influence of base material thickness

h/h_{min}	1,0	1,1	1,2	1,3	1,4	1,5	1,6	1,7	1,8	$\geq 1,84$
$f_{h,sp} = [h/(h_{min})]^{2/3}$	1	1,07	1,13	1,19	1,25	1,31	1,37	1,42	1,48	1,5

Influence of reinforcement ^{a)}

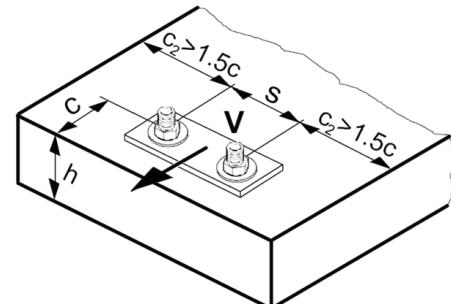

Anchor size	M6			M8			M10		
Effective anchorage depth h_{ef} [mm]	30	40	60	30	40	70	40	50	80
$f_{re,N} = 0,5 + h_{ef}/200\text{mm} \leq 1$	0,65	0,7	0,8	0,65	0,7	0,85	0,7	0,75	0,9

Anchor size	M12			M16			M20		
Effective anchorage depth h_{ef} [mm]	50	65	100	65	80	120	75	100	115
$f_{re,N} = 0,5 + h_{ef}/200\text{mm} \leq 1$	0,75	0,83	1	0,83	0,9	1	0,88	1	1

- a) This factor applies only for dense reinforcement. If in the area of anchorage there is reinforcement with a spacing ≥ 150 mm (any diameter) or with a diameter ≤ 10 mm and a spacing ≥ 100 mm, then a factor $f_{re,N} = 1$ may be applied.

Shear loading**The design shear resistance is the lower value of**

- Steel resistance: $V_{Rd,s}$
- Concrete prout resistance: $V_{Rd,cp} = k \cdot N_{Rd,c}$
- Concrete edge resistance: $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_B \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

**Basic design shear resistance****Design steel resistance $V_{Rd,s}$**

Anchor size	M6	M8	M10	M12	M16	M20
$V_{Rd,s}$ HSA, HSA-BW [kN]	5,2	8,5	15,1	23,6	40,8	68,6
HSA-R2, HSA-R [kN]	5,8	9,8	18,1	23,4	45,2	73,5

Design concrete prayout resistance $V_{Rd,cp} = k \cdot N_{Rd,c}$ ^{a)}

Anchor size	M6			M8			M10		
Effective anchorage depth h_{ef} [mm]	30	40	60	30	40	70	40	50	80
k	1	1	2	1	1,5	2	2,4	2,4	2,4
Anchor size	M12			M16			M20		
Effective anchorage depth h_{ef} [mm]	50	65	100	65	80	120	75	100	115
k	2	2	2	2,9	2,9	2,9	2	3,5	3,5

a) $N_{Rd,c}$: Design concrete cone resistance

Design concrete edge resistance $V_{Rd,c}^0 = V_{Rd,c}^0 \cdot f_B \cdot f_\beta \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Anchor size	M6			M8			M10		
Effective anchorage depth h_{ef} [mm]	30	40	60	30	40	70	40	50	80
$V_{Rd,c}^0$ [kN]	3,6	3,6	3,7	5,8	5,9	6,0	8,5	8,5	8,6
Anchor size	M12			M16			M20		
Effective anchorage depth h_{ef} [mm]	50	65	100	65	80	120	75	100	115
$V_{Rd,c}^0$ [kN]	11,6	11,6	11,7	18,7	18,8	18,9	27,2	27,3	27,4

a) For anchor groups only the anchors close to the edge must be considered.

Influencing factors

Influence of concrete strength

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25\text{ N/mm}^2)^{1/2}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of angle between load applied and the direction perpendicular to the free edge

Angle β	0°	10°	20°	30°	40°	50°	60°	70°	80°	≥ 90°

$f_{hef} = 0,05 \cdot (h_{ef} / d)^{1,68}$	0,55	0,85	1,76	0,53	0,75	1,48	0,46	0,75	0,94

Influence of edge distance ^{a)}

c/d	4	6	8	10	15	20	30	40
$f_c = (d / c)^{0,19}$	0,77	0,71	0,67	0,65	0,60	0,57	0,52	0,50

a) The edge distance shall not be smaller than the minimum edge distance c_{min} .

Combined tension and shear loading

For combined tension and shear loading see section "Anchor Design".

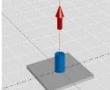

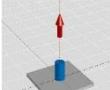

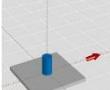

Precalculated values

Design resistance calculated according ETAG 001, Annex C and Hilti technical data.
All data applies to concrete C 20/25 – $f_{ck,cube} = 25 \text{ N/mm}^2$.

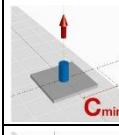

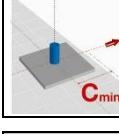

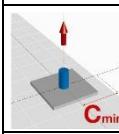

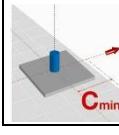

Recommended loads can be calculated by dividing the design resistance by an overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Design resistance

Single anchor, no edge effects

Anchor size		M6			M8			M10		
Effective anchorage depth	h_{ef} [mm]	30	40	60	30	40	70	40	50	80

HSA-F Stud anchor

Anchor version	Benefits
 <p>HSA-F; Carbon steel, hot dipped galvanized, min 35 microns coating thickness DIN 125 washer</p>	<ul style="list-style-type: none"> - Hot dipped galvanized material for increased corrosion resistance - Three embedment depths for maximal design flexibility - Suitable for pre- and through fastening

Concrete

Basic loading data (for a single anchor)

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Steel failure
- Minimum base material thickness
- Non-cracked Concrete C 20/25, $f_{ck,cube} = 25 \text{ N/mm}^2$

For details see Simplified design method

Anchor dimensions and coding

Product marking and identification of anchor

Beginning of thread: setting depth indicator for $h_{\text{nom},1}$, $h_{\text{nom},1}$ is reached when non-threaded part of the bolt is completely below the concrete surface

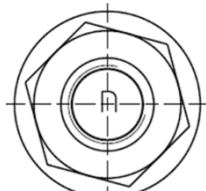

Blue ring: setting depth indicator for $h_{\text{nom},2}$, $h_{\text{nom},2}$ is reached when the blue ring is completely below the concrete surface

e.g.

Hilti HSA-F ... Brand and Anchor type

M12 65/50/15 ... Anchor Size and the max. $t_{\text{fix},1}$ / $t_{\text{fix},2}$ / $t_{\text{fix},3}$ for the corresponding $h_{\text{nom},1}$ / $h_{\text{nom},2}$ / $h_{\text{nom},3}$

Setting**Installation equipment**

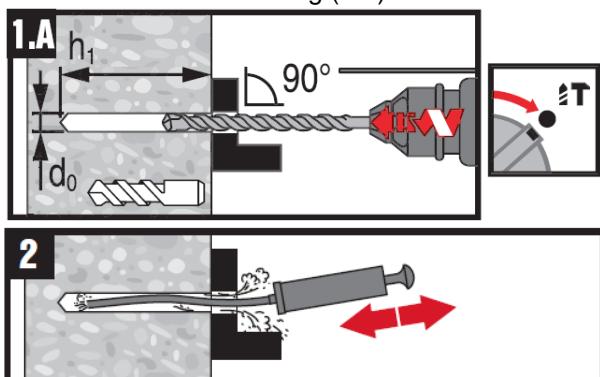

Anchor size	M6	M8	M10	M12	M16	M20
Rotary hammer	TE2 – TE16					
Other tools	hammer, torque wrench, blow out pump					

Setting instruction

Drill and clean borehole

Standard drilling method

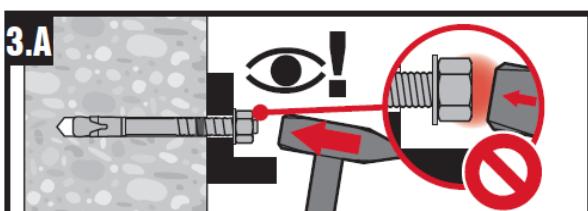

M6 – M20: Hammer drilling (HD)

Install anchor with hammer or machine setting tool

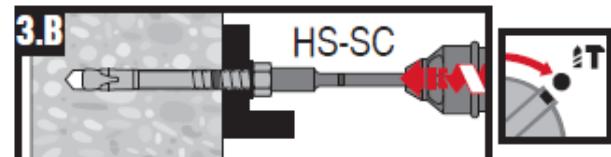

Standard setting method

M6 – M20: Hammer setting

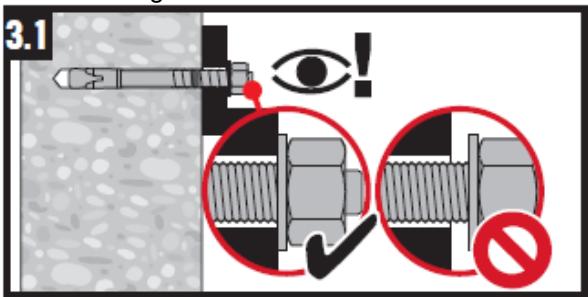

Alternative setting method

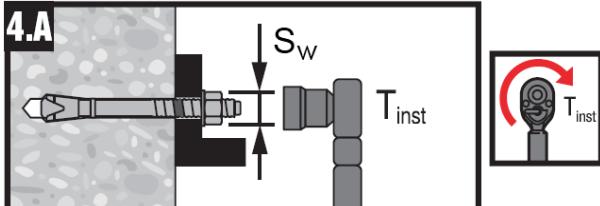

M8 – M16: Machine setting

Check setting

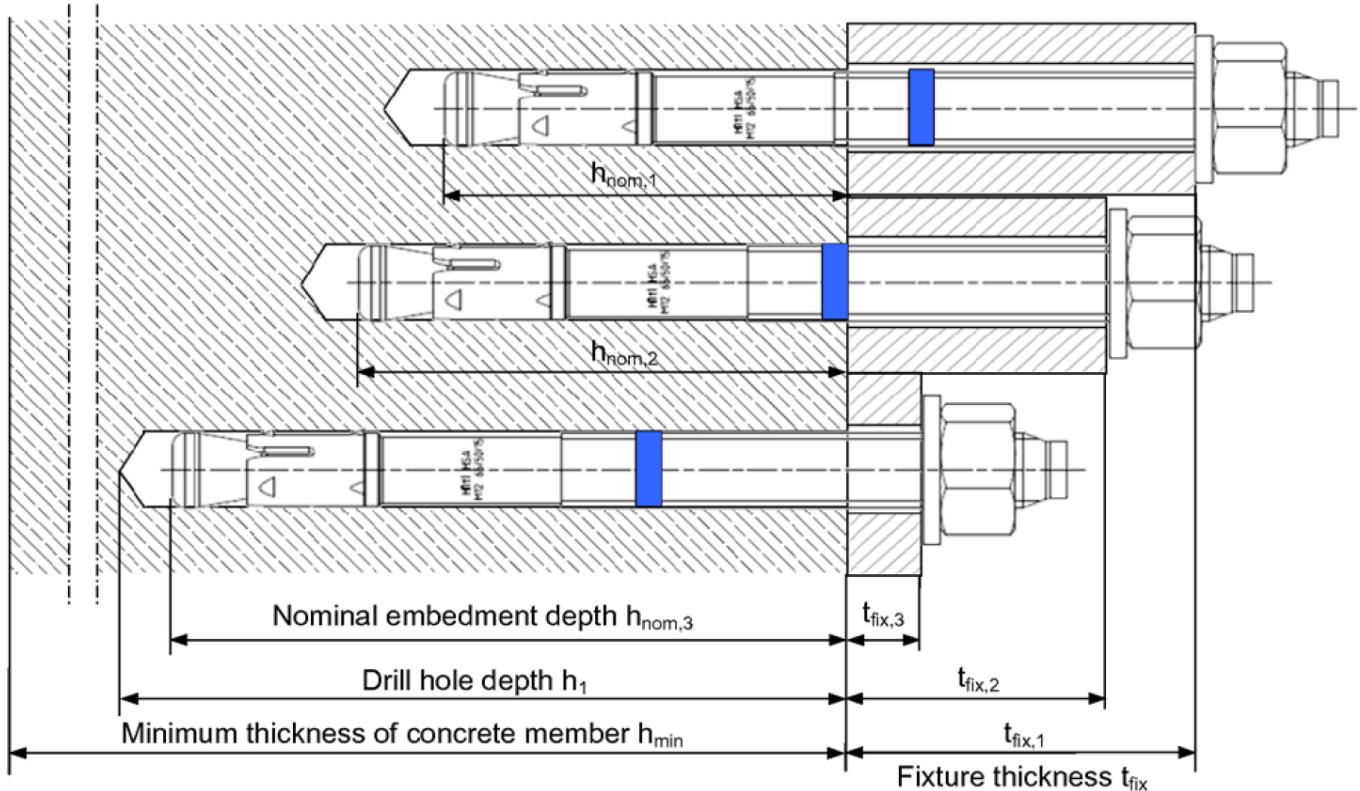

Tightening the anchor

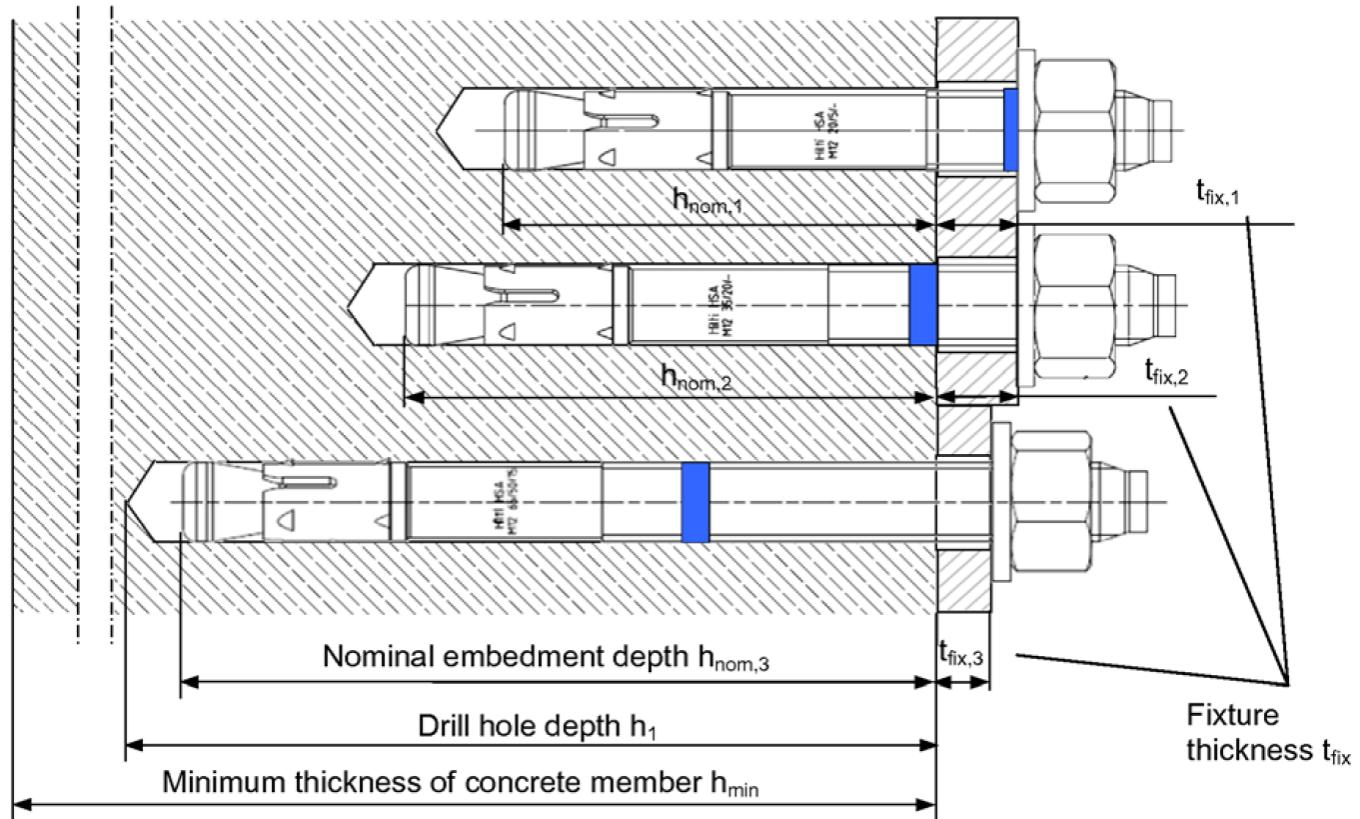

For detailed information on installation see instruction for use given with the package of the product.

Setting details

One anchor length for different fixture thickness t_{fix} and the corresponding setting positions

Different anchor length for different setting positions and the corresponding fixture thickness t_{fix}

Setting details

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced.

Simplified design method

Simplified version of the design method according ETAG 001, Annex C. Design resistance according Hilti technical data.

- Influence of concrete strength
- Influence of edge distance
- Influence of spacing
- Valid for a group of two anchors. (The method may also be applied for anchor groups with more than two anchors or more than one edge. The influencing factors must then be considered for each edge distance and spacing. The calculated design loads are then conservative: They will be lower than the exact values according ETAG 001, Annex C. To avoid this, it is recommended to use the anchor design software PROFIS anchor)

The design method is based on the following simplification:

- No different loads are acting on individual anchors (no eccentricity)

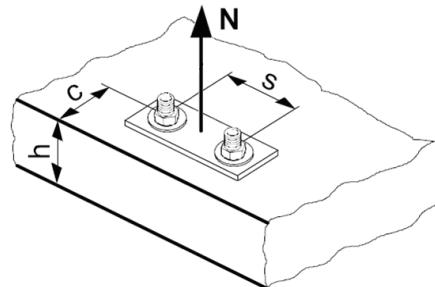

The values are valid for one anchor.

For more complex fastening applications please use the anchor design software PROFIS Anchor.

Tension loading

The design tensile resistance is the lower value of

- Steel resistance: $N_{Rd,s}$
- Concrete pull-out resistance: $N_{Rd,p} = N^0_{Rd,p}$
- Concrete cone resistance: $N_{Rd,c} = N^0_{Rd,c} \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{re,N}$
- Concrete splitting resistance: $N_{Rd,sp} = N^0_{Rd,sp} \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,sp} \cdot f_{re,N}$

Basic design tensile resistance

Design steel resistance $N_{Rd,s}$

Anchor size	M6	M8	M10	M12	M16	M20
$N_{Rd,s}$ HSA-F [kN]	6,4	11,8	20,0	29,6	59,0	88,5

Design pull-out resistance $N_{Rd,p} = N^0_{Rd,p}$

$N_{Rd,p}^0$ HSA-F [kN]	11,9	17,6	33,7	17,6	24,1	44,3	21,9	33,7	41,5

Influencing factors

Influence of concrete strength

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
Pull-out, concrete cone and splitting resistance							
$f_B = (f_{ck,cube}/25\text{N/mm}^2)^{1/2}$ ^{a)}	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of edge distance ^{a)}

$c/c_{cr,N}$	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$c/c_{cr,sp}$										
$f_{1,N} = 0,7 + 0,3 \cdot c/c_{cr,N} \leq 1$	0,73	0,76	0,79	0,82	0,85	0,88	0,91	0,94	0,97	1
$f_{1,sp} = 0,7 + 0,3 \cdot c/c_{cr,sp} \leq 1$										
$f_{2,N} = 0,5 \cdot (1 + c/c_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{2,sp} = 0,5 \cdot (1 + c/c_{cr,sp}) \leq 1$										

a) The edge distance shall not be smaller than the minimum edge distance c_{min} given in the table with the setting details. These influencing factors must be considered for every edge distance.

Influence of anchor spacing ^{a)}

$s/s_{cr,N}$	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$s/s_{cr,sp}$										
$f_{3,N} = 0,5 \cdot (1 + s/s_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{3,sp} = 0,5 \cdot (1 + s/s_{cr,sp}) \leq 1$										

a) The anchor spacing shall not be smaller than the minimum anchor spacing s_{min} given in the table with the setting details. This influencing factor must be considered for every anchor spacing.

Influence of base material thickness

h/h_{min}	1,0	1,1	1,2	1,3	1,4	1,5	1,6	1,7	1,8	$\geq 1,84$
$f_{h,sp} = [h/(h_{min})]^{2/3}$	1	1,07	1,13	1,19	1,25	1,31	1,37	1,42	1,48	1,5

Influence of reinforcement ^{a)}

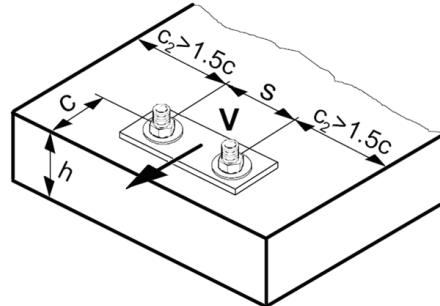

Anchor size	M6			M8			M10		
Effective anchorage depth h _{ef} [mm]	30	40	30	40	70	40	50	80	
f _{re,N} = 0,5 + h _{ef} /200mm ≤ 1	0,65	0,7	0,65	0,7	0,85	0,7	0,75	0,9	
Anchor size	M12			M16			M20		
Effective anchorage depth h _{ef} [mm]	50	65	100	65	80	120	75	100	115
f _{re,N} = 0,5 + h _{ef} /200mm ≤ 1	0,75	0,83	1	0,83	0,9	1	0,88	1	1

- b) This factor applies only for dense reinforcement. If in the area of anchorage there is reinforcement with a spacing ≥ 150 mm (any diameter) or with a diameter ≤ 10 mm and a spacing ≥ 100 mm, then a factor f_{re,N} = 1 may be applied.

Shear loading

The design shear resistance is the lower value of

- Steel resistance: V_{Rd,s}
- Concrete prout resistance: V_{Rd,cp} = k · N_{Rd,c}
- Concrete edge resistance: V_{Rd,c} = V⁰_{Rd,c} · f_B · f_B · f_h · f₄ · f_{hef} · f_c

Basic design shear resistance

Design steel resistance V_{Rd,s}

Anchor size	M6	M8	M10	M12	M16	M20
V _{Rd,s} HSA-F [kN]	5,2	8,5	15,1	23,6	40,8	68,6

Design concrete prout resistance V_{Rd,cp} = k · N_{Rd,c} ^{a)}

Anchor size	M6			M8			M10		
Effective anchorage depth h _{ef} [mm]	30	40	30	40	70	40	50	80	
k	1	1	1	1,5	2	2,4	2,4	2,4	
Anchor size	M12			M16			M20		
Effective anchorage depth h _{ef} [mm]	50	65	100	65	80	120	75	100	115
k	2	2	2	2,9	2,9	2,9	2	3,5	3,5

a) N_{Rd,c}: Design concrete cone resistance

Design concrete edge resistance ^{a)} $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_\beta \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Anchor size	M6			M8			M10		
Effective anchorage depth h_{ef} [mm]	30		40		30	40	70	40	50
$V_{Rd,c}^0$ [kN]	3,6		3,6		5,8	5,9	6,0	8,5	8,5
Anchor size	M12			M16			M20		
Effective anchorage depth h_{ef} [mm]	50	65	100	65	80	120	75	100	115
$V_{Rd,c}^0$ [kN]	11,6	11,6	11,7	18,7	18,8	18,9	27,2	27,3	27,4

b) For anchor groups only the anchors close to the edge must be considered.

Influencing factors

Influence of concrete strength

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25\text{ N/mm}^2)^{1/2}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of angle between load applied and the direction perpendicular to the free edge

Angle β	0°	10°	20°	30°	40°	50°	60°	70°	80°	≥ 90°

a) The anchor spacing and the edge distance shall not be smaller than the minimum anchor spacing s_{min} and the minimum edge distance c_{min} .

Influence of embedment depth

Anchor size	M6		M8			M10		
Effective anchorage depth h_{ef} [mm]	30	40	30	40	70	40	50	80
$f_{hef} = 0,05 \cdot (h_{ef} / d)^{1,68}$	0,75	1,21	0,46	0,75	1,91	0,51	0,75	1,64

Anchor size	M12			M16			M20		
Effective anchorage depth h_{ef} [mm]	50	65	100	65	80	120	75	100	115
$f_{hef} = 0,05 \cdot (h_{ef} / d)^{1,68}$	0,55	0,85	1,76	0,53	0,75	1,48	0,46	0,75	0,94

Influence of edge distance ^{a)}

c/d	4	6	8	10	15	20	30	40
$f_c = (d / c)^{0,19}$	0,77	0,71	0,67	0,65	0,60	0,57	0,52	0,50

a) The edge distance shall not be smaller than the minimum edge distance c_{min} .

Combined tension and shear loading

For combined tension and shear loading see section "Anchor Design".

HSV Stud anchor

Anchor versions		Benefits
	HSV Carbon steel with DIN 125 washer	<ul style="list-style-type: none"> - torque-controlled mechanical expansion allows immediate load application - setting mark - cold-formed to prevent breaking during installation - raised impact section prevents thread damage during installation - drill bit size is same as anchor size for easy installation.
	HSV-BW Carbon steel with DIN 9021 washer and DIN 127b spring washer	

Concrete

Basic loading data (for a single anchor)

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Concrete as specified in the table
- Steel failure
- Minimum base material thickness
- Concrete C 20/25, $f_{ck,cube} = 25 \text{ N/mm}^2$

Mean ultimate resistance

Anchor size	M8		M10		M12		M16	
Effective anchorage depth $h_{ef} \geq$ [mm]	30	40	40	50	50	65	65	80
Tensile $N_{Ru,m}$ [kN]	11,0	15,9	15,9	18,6	19,2	26,6	35,1	48,0
Shear $V_{Ru,m}$ [kN]	8,9	8,9	15,1	15,1	23,7	23,7	44,5	44,5

Characteristic resistance

Anchor size	M8		M10		M12		M16	
Effective anchorage depth $h_{ef} \geq$ [mm]	30	40	40	50	50	65	65	80
Tensile N_{Rk} [kN]	8,3	12,0	12,0	14,0	14,5	20,0	26,5	36,1
Shear V_{Rk} [kN]	8,3	8,5	12,8	14,4	17,9	22,6	42,4	42,4

Design resistance

Anchor size	M8		M10		M12		M16	
Effective anchorage depth $h_{\text{ef}} \geq$ [mm]	30	40	40	50	50	65	65	80
Tensile N_{Rd} [kN]	4,6	6,7	8,0	9,3	9,7	13,3	14,7	20,1
Shear V_{Rd} [kN]	5,5	6,8	8,5	11,5	11,9	18,1	33,9	33,9

Recommended loads

Anchor size	M8		M10		M12		M16	
Effective anchorage depth $h_{\text{ef}} \geq$ [mm]	30	40	40	50	50	65	65	80
Tensile $N_{\text{rec}}^{\text{a)}$ [kN]	3,3	4,8	5,7	6,7	6,9	9,5	10,5	14,3
Shear $V_{\text{rec}}^{\text{a)}$ [kN]	4,0	4,9	6,1	8,2	8,5	12,9	24,2	24,2

a) With overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Materials

Mechanical properties of HSV

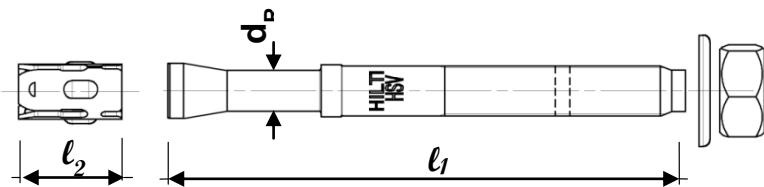

Anchor size	M8	M10	M12	M16
Nominal tensile strength f_{uk} [N/mm ²]	580	660	660	660
Yield strength f_{yk} [N/mm ²]	464	528	528	528
Stressed cross-section, thread A_s [mm ²]	36,6	58,0	84,3	157
Stressed cross-section, neck $A_{s,\text{neck}}$ [mm ²]	26,9	39,6	63,6	105,7
Moment of resistance W [mm ³]	31,2	62,3	109,2	277,5
Char. bending resistance $M_{\text{Rk,s}}^0$ [Nm]	19,5	41,1	72,1	166,5

Material quality

Part	Material
Bolt	Carbon steel, galvanised to min. 5 µm

Anchor dimensions

Anchor size	M8	M10	M12	M16
Shaft diameter at the cone d_R [mm]	5,85	7,1	9	11,6
Maximum length of the anchor ℓ_1 [mm]	75	100	150	140
Length of expansion sleeve ℓ_2 [mm]	15	17,6	20,6	24

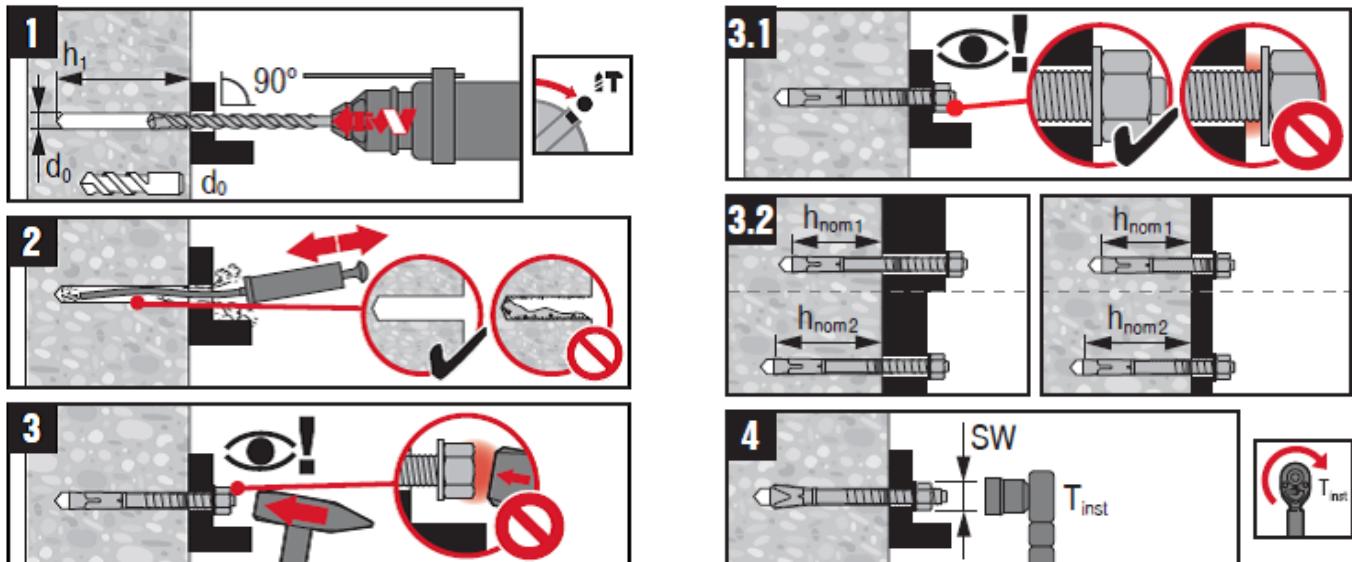

Setting

Installation equipment

Anchor size	M8	M10	M12	M16
Rotary hammer		TE1 – TE30		
Other tools		blow out pump, hammer, torque wrench		

Setting instruction

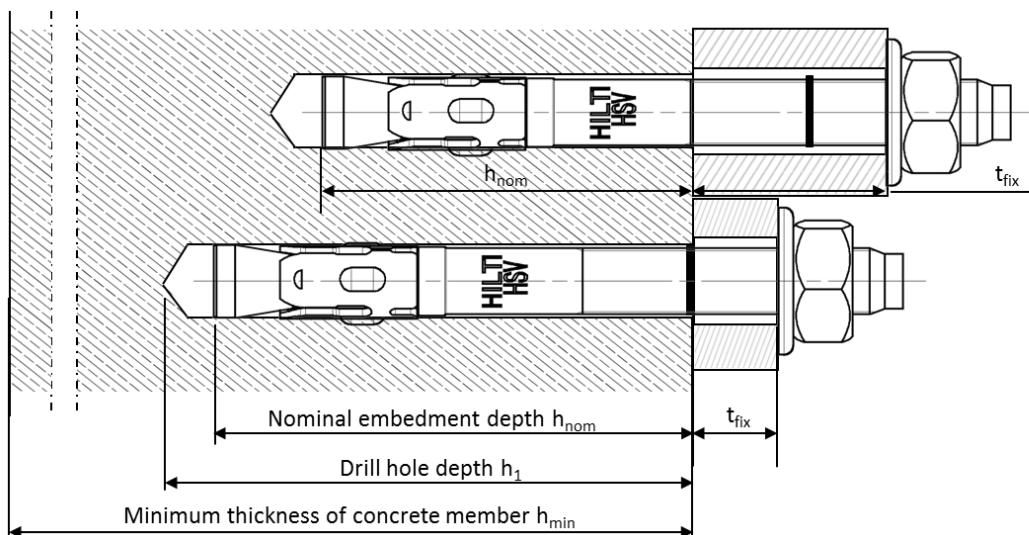

For detailed information on installation see instruction for use given with the package of the product.

Setting details

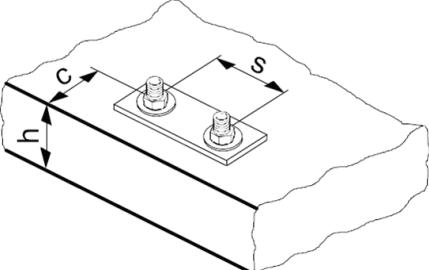

Anchor size	M8		M10		M12		M16	
Effective anchorage depth h_{ef} [mm]	30	40	40	50	50	65	65	80
Nominal embedment depth h_{nom} [mm]	39	49	51	61	62	77	81	96
Nominal Diameter of drill bit d_0 [mm]	8		10		12		16	
Cutting diameter of drill bit $d_{cut} \leq$ [mm]	8,45		10,45		12,5		16,5	
Depth of drill hole $h_1 \geq$ [mm]	45	55	60	70	70	85	90	105
Diameter of clearance hole in the fixture $d_f \leq$ [mm]	9		12		14		18	
Minimum thickness of fixture a) $t_{fix,min}$ [mm]	5	0	5	0	5	0	5	0
Maximum thickness of fixture a) $t_{fix,max}$ [mm]	20	10	35	25	70	55	35	20
Torque moment T_{inst} [Nm]	15		30		50		100	
Width across nut flats SW [mm]	13		17		19		24	

- a) The values are only valid for HSV with standard washer. For HSV-BW with DIN 9021 washer and DIN 127b spring washer the thickness of the fixture has to be reduced.

Setting parameters ^{a)}

Anchor size	M8		M10		M12		M16	
Effective anchorage depth h_{ef} [mm]	30	40	40	50	50	65	65	80
Minimum base material thickness $h_{min} \geq$ [mm]	100	100	100	120	140	140	130	170
Minimum spacing $s_{min} \geq$ [mm]	60	60	70	70	80	80	120	100
Minimum edge distance $c_{min} \geq$ [mm]	60	60	70	70	90	90	120	100
Critical spacing for splitting failure $s_{cr,sp}$ [mm]	180	240	240	300	300	390	390	480
Critical edge distance for splitting failure $c_{cr,sp}$ [mm]	90	120	120	150	150	195	195	240
Critical spacing for concrete cone failure $s_{cr,N}$ [mm]	90	120	120	150	150	195	195	240
Critical edge distance for concrete cone failure $c_{cr,N}$ [mm]	45	60	60	75	75	97,5	97,5	120

c) In case of smaller edge distance and spacing than $c_{cr,sp}$, $s_{cr,sp}$, $c_{cr,N}$ and $s_{cr,N}$ the load values shall be reduced according ETAG 001, Annex C

Simplified design method

Simplified version of the design method according ETAG 001, Annex C.

- Influence of concrete strength
- Influence of edge distance
- Influence of spacing
- Valid for a group of two anchors. The method may also be applied for anchor groups with more than two anchors or more than one edge. The influencing factors must then be considered for each edge distance and spacing. The calculated design loads are then on the save side: They will be lower than the exact values according ETAG 001, Annex C.

The design method is based on the following simplification:

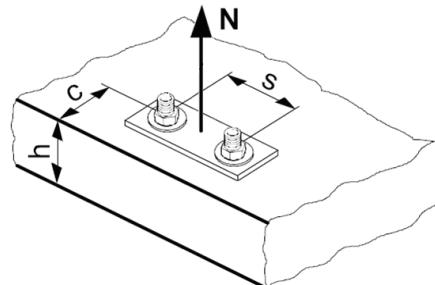

- No different loads are acting on individual anchors (no eccentricity)

The values are valid for one anchor.

Tension loading

The design tensile resistance is the lower value of

- Steel resistance: $N_{Rd,s}$
- Concrete pull-out resistance: $N_{Rd,p} = N^0_{Rd,p} \cdot f_B$
- Concrete cone resistance: $N_{Rd,c} = N^0_{Rd,c} \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{re,N}$
- Concrete splitting resistance (only non-cracked concrete):
 $N_{Rd,sp} = N^0_{Rd,c} \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,sp} \cdot f_{re,N}$

Basic design tensile resistance

Design steel resistance $N_{Rd,s}$

Anchor size	M8		M10		M12		M16	
Effective anchorage depth h_{ef} [mm]	30	40	40	50	50	65	65	80
$N_{Rd,s}$ [kN]	10,4		17,4		28,0		46,5	

Design pull-out resistance $N_{Rd,p} = N^0_{Rd,p} \cdot f_B$

Anchor size	M8		M10		M12		M16	
Effective anchorage depth h_{ef} [mm]	30	40	40	50	50	65	65	80
$N^0_{Rd,p}$ [kN]	6,7	6,7	8,0	9,3	9,7	13,3	16,6	20,8

Design concrete cone resistance $N_{Rd,c} = N^0_{Rd,c} \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{re,N}$

Design splitting resistance ^{a)} $N_{Rd,sp} = N^0_{Rd,c} \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,sp} \cdot f_{re,N}$

Anchor size	M8		M10		M12		M16	
Effective anchorage depth h_{ef} [mm]	30	40	40	50	50	65	65	80
$N^0_{Rd,c}$ [kN]	4,6	7,1	8,5	11,9	11,9	17,6	14,7	20,1

Influencing factors

Influence of concrete strength

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
Pull-out resistance							
$f_B =$					1		
Concrete cone and splitting resistance							
$f_B = (f_{ck,cube}/25\text{N/mm}^2)^{1/2}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of edge distance ^{a)}

c/c_{cr,N}	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
c/c_{cr,sp}										
$f_{1,N} = 0,7 + 0,3 \cdot c/c_{cr,N} \leq 1$	0,73	0,76	0,79	0,82	0,85	0,88	0,91	0,94	0,97	1
$f_{1,sp} = 0,7 + 0,3 \cdot c/c_{cr,sp} \leq 1$										
$f_{2,N} = 0,5 \cdot (1 + c/c_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{2,sp} = 0,5 \cdot (1 + c/c_{cr,sp}) \leq 1$										

- a) The edge distance shall not be smaller than the minimum edge distance c_{min} given in the table with the setting details. These influencing factors must be considered for every edge distance.

Influence of anchor spacing ^{a)}

s/s_{cr,N}	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
s/s_{cr,sp}										
$f_{3,N} = 0,5 \cdot (1 + s/s_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{3,sp} = 0,5 \cdot (1 + s/s_{cr,sp}) \leq 1$										

- a) The anchor spacing shall not be smaller than the minimum anchor spacing s_{min} given in the table with the setting details. This influencing factor must be considered for every anchor spacing.

Influence of base material thickness

h/h_{ef}	2,0	2,2	2,4	2,6	2,8	3,0	3,2	3,4	3,6	≥ 3,68
$f_{h,sp} = [h/(2 \cdot h_{ef})]^{2/3}$	1	1,07	1,13	1,19	1,25	1,31	1,37	1,42	1,48	1,5

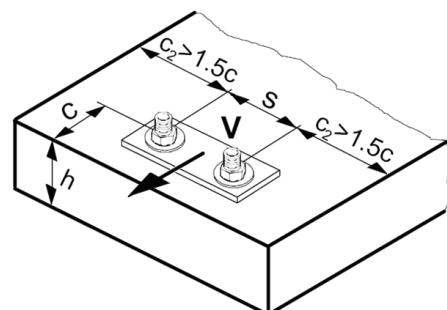

Influence of reinforcement

Anchor size	M8		M10		M12		M16	
Effective anchorage depth h_{ef} [mm]	30	40	40	50	50	65	65	80
$f_{re,N} = 0,5 + h_{ef}/200\text{mm} \leq 1$	0,65 ^{a)}	0,7 ^{a)}	0,7 ^{a)}	0,75 ^{a)}	0,75 ^{a)}	0,825 ^{a)}	0,825 ^{a)}	0,9 ^{a)}

- c) This factor applies only for dense reinforcement. If in the area of anchorage there is reinforcement with a spacing ≥ 150 mm (any diameter) or with a diameter ≤ 10 mm and a spacing ≥ 100 mm, then a factor $f_{re,N} = 1$ may be applied.

Shear loading**The design shear resistance is the lower value of**

- Steel resistance: $V_{Rd,s}$
- Concrete prout resistance: $V_{Rd,cp} = k \cdot N_{Rd,c}$
- Concrete edge resistance: $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_\beta \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Basic design shear resistance

Design steel resistance $V_{Rd,s}$

Anchor size	M8		M10		M12		M16	
Effective anchorage depth h_{ef} [mm]	30	40	40	50	50	65	65	80
$V_{Rd,s}$ [kN]	6,8		11,5		18,1		33,9	

Design concrete prout resistance $V_{Rd,cp} = k \cdot N_{Rd,c}$ ^{a)}

Anchor size	M8		M10		M12		M16	
Effective anchorage depth h_{ef} [mm]	30	40	40	50	50	65	65	80
k	1		2					

a) $N_{Rd,c}$: Design concrete cone resistance

Design concrete edge resistance ^{a)} $V_{Rd,c}^0 = V_{Rd,c}^0 \cdot f_B \cdot f_\beta \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Anchor size	M8		M10		M12		M16	
Effective anchorage depth h_{ef} [mm]	30	40	40	50	50	65	65	80
$V_{Rd,c}^0$ [kN]	9,1	9,0	13,0	13,0	17,6	17,6	28,3	28,2

a) For anchor groups only the anchors close to the edge must be considered.

Influencing factors

Influence of concrete strength

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25\text{N/mm}^2)^{1/2}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of angle between load applied and the direction perpendicular to the free edge

Angle β	0°	10°	20°	30°	40°	50°	60°	70°	80°	≥ 90°

Fire resistance

Approvals / certificates

Description	Authority / Laboratory	No. / date of issue
Fire test report	IBMB, Braunschweig	PB 3093/517/07-CM / 2007-09-10
Assessment report (fire)	warringtonfire	WF 327804/A / 2013-07-10

Basic loading data (for a single anchor)

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Concrete as specified in the table
- Steel failure
- Minimum base material thickness
- Concrete C 20/25, $f_{ck,cube} = 25 \text{ N/mm}^2$

Characteristic resistance

Anchor size	6,5	8	10	12	16	20
Tensile N_{Rk} [kN]	2,1	3,5	4,5	7,2	10,0	13,2
Shear V_{Rk} [kN]	3,2	7,0	8,8	14,4	20,0	20,0

Design resistance

Anchor size	6,5	8	10	12	16	20
Tensile N_{Rd} [kN]	1,2	2,0	2,5	4,0	5,6	7,4
Tensile N_{Rd} [kN]	1,8	3,9	4,9	8,0	11,1	11,1

Recommended loads

Anchor size	6,5	8	10	12	16	20
Tensile $N_{rec}^a)$ [kN]	0,8	1,4	1,8	2,9	4,0	5,3
Shear $V_{rec}^a)$ [kN]	1,3	2,8	3,5	5,7	7,9	7,9

a) With overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

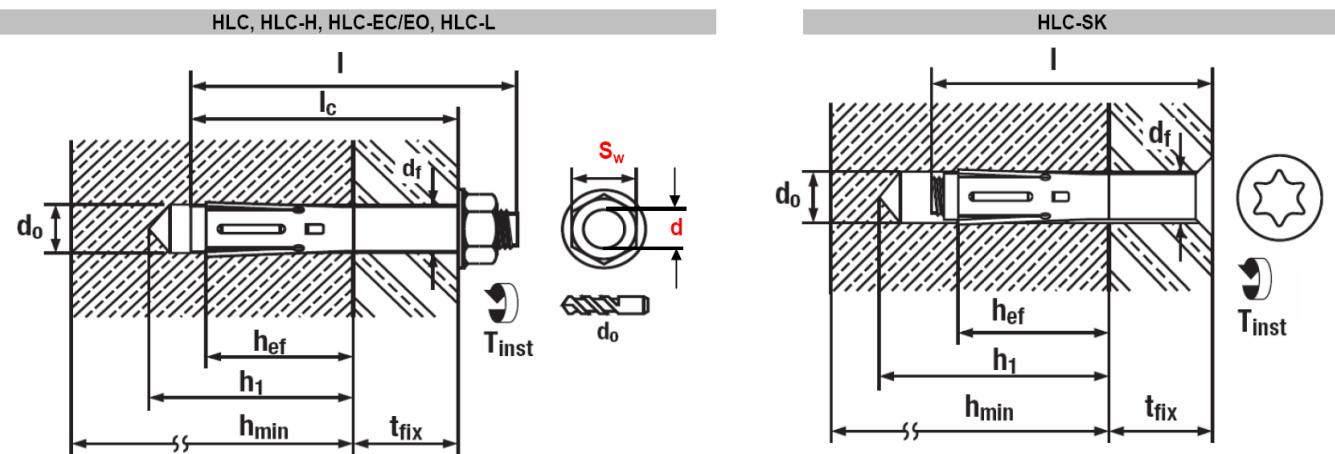

Materials

Material quality

Part	Material	
Anchor	HLC HLC-EC HLC-EO	Carbon steel minimum tensile strength 500 MPa galvanised to min. 5 µm
	HLC-H HLC-L HLC-SK HLC-T	Steel Bolt Strength 8.8, galvanised to min. 5 µm

Anchor dimensions

Max. torque moment masonry	T _{inst} [Nm]	2,5	4	13	20	25	-

Base material thickness, anchor spacing and edge distance

Anchor size		6,5	8	10	12	16	20
Minimum base material thickness	h_{\min} [mm]	60	70	80	100	100	120
Critical spacing for splitting failure and concrete cone failure	s_{cr} [mm]	60	100	120	130	160	160
Critical edge distance for splitting failure and concrete cone failure	c_{cr} [mm]	30	50	60	65	80	80

**Basic loading data for single anchor in solid masonry units****All data in this section applies to**

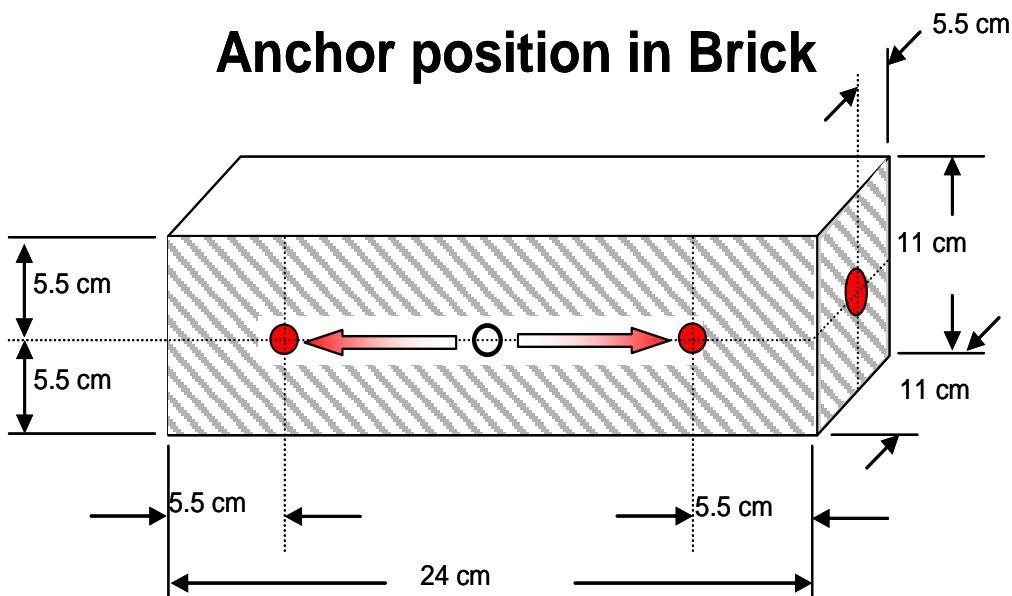

- Load values valid for holes drilled with TE rotary hammers in hammering mod
- Correct anchor setting (see instruction for use, setting details)
- The core / material ratio may not exceede 15% of a bed joint area.
- The brim area around holes must be at least 70mm
- Edge distances, spacing and other influences, see below

Recommended loads^{a)}

			Hilti				
Base material		Anchor size	6,5	8	10	12	16
Germany, Austria, Switzerland		h_{nom} [mm]	16	26	31	33	41
Solid clay brick Mz12/2,0 	DIN 105/ EN 771-1 $f_b^{b)} \geq 12 \text{ N/mm}^2$	Tensile $N_{rec}^{c)}$ [kN]	0,3	0,5	0,6	0,7	0,8
		Shear $V_{rec}^{c)}$ [kN]	0,45	1,0	1,2	1,4	1,6
Solid sand-lime brick KS 12/2,0 	DIN 106/ EN 771-2 $f_b^{b)} \geq 12 \text{ N/mm}^2$	Tensile $N_{rec}^{d)}$ [kN]	0,4	0,5	0,6	0,8	0,8
		Shear $V_{rec}^{d)}$ [kN]	0,65	1,0	1,2	1,6	1,6

a) Recommended load values for German base materials are based on national regulations.

b) f_b = brick strengthc) Values only valid for Mz (DIN 105) with brick strength $\geq 19 \text{ N/mm}^2$, density $2,0 \text{ kg/dm}^3$, minimum brick size NF (24,0cm x 11,5cm x 11,5cm)d) Values only valid for KS (DIN 106) with brick strength $\geq 29 \text{ N/mm}^2$, density $2,0 \text{ kg/dm}^3$, minimum brick size NF (24,0cm x 11,5cm x 11,5cm)

Permissible anchor location in brick and block walls**Anchor position in Brick****Edge distance and spacing influences**

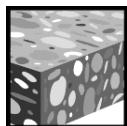

- The technical data for the HLC sleeve anchors are reference loads for MZ 12 and KS 12. Due to the large variation of natural stone solid bricks, on site anchor testing is recommended to validate technical data.
- The HLC anchor was installed and tested in center of solid bricks as shown. The HLC anchor was not tested in the mortar joint between solid bricks or in hollow bricks, however a load reduction is expected.
- For brick walls where anchor position in brick can not be determined, 100% anchor testing is recommended.
- Distance to free edge free edge to solid masonry (Mz and KS) units ≥ 300 mm
- The minimum distance to horizontal and vertical mortar joint (c_{min}) is stated in the drawing above.
- Minimum anchor spacing (s_{min}) in one brick/block is $\geq 2*c_{min}$

Limits

- Applied load to individual bricks may not exceed 1,0 kN without compression or 1,4 kN with compression
- All data is for multiple use for non structural applications
- Plaster, graveling, lining or levelling courses are regarded as non-bearing and may not be taken into account for the calculation of embedment depth.

HLV Sleeve anchor

Anchor version	Benefits
 <p>Pre-setting</p> <p>HLV 6,5x22/7 HLV 8x35/4 HLV 10x45/10 HLV 12x48/10 HLV 12x60/17 HLV 16x68/20</p>  <p>Through fastening</p> <p>HLV 8x35/10 HLV 10x75/45 HLV 12x95/60 HLV 16x130/90</p>	<ul style="list-style-type: none"> - Available in a variety of sizes in both pre-setting and through fastening configurations - Carbon steel grade 4.8, zinc galvanized to min 5µm

Concrete

Basic loading data (for a single anchor)

All data in this section is Hilti technical data and applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Minimum base material thickness
- Concrete C20/25 – C50/60, $f_{ck,cube} = 25 \text{ N/mm}^2 - 60 \text{ N/mm}^2$

Characteristic resistance

Impact screw driver	Hilti SIW 22 T-A								

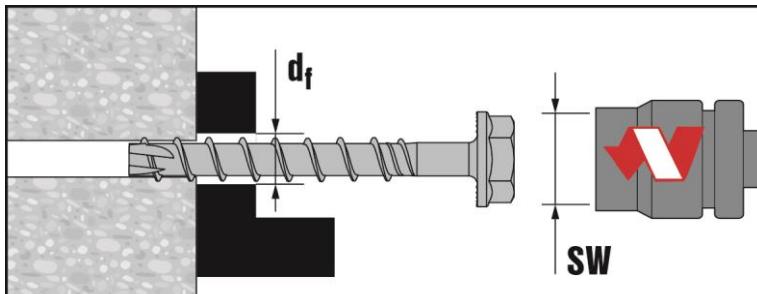

Setting instruction

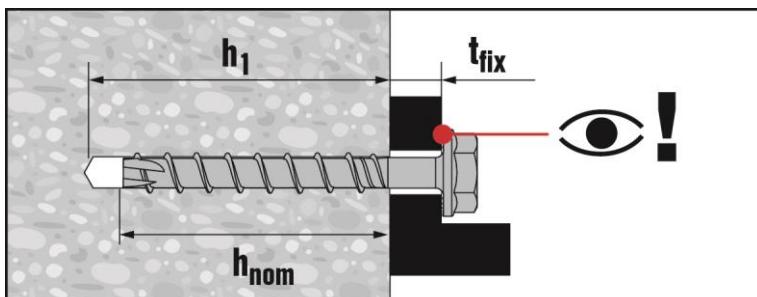

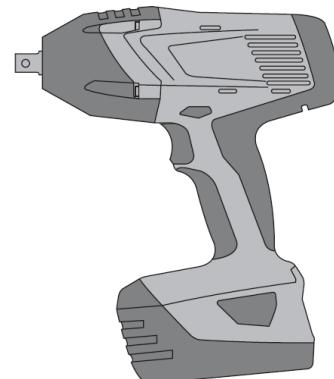

Make a cylindrical hole

Clean the borehole

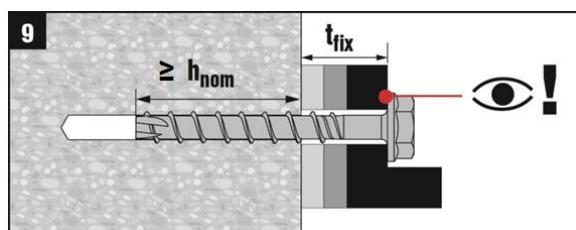

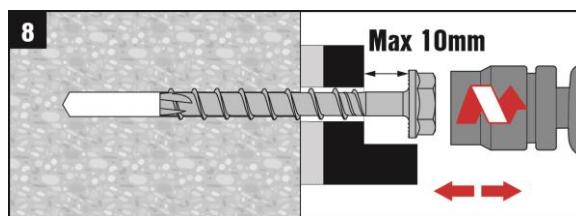

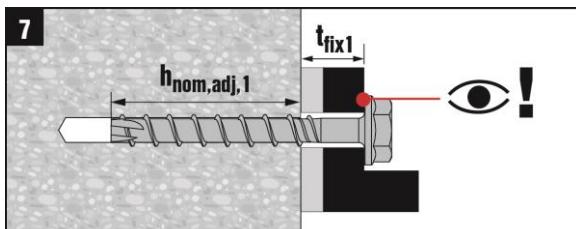

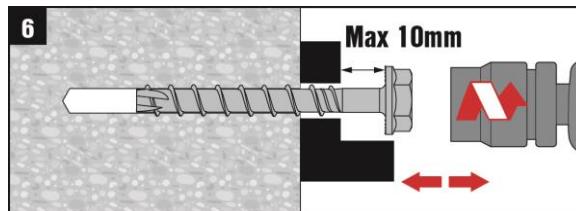

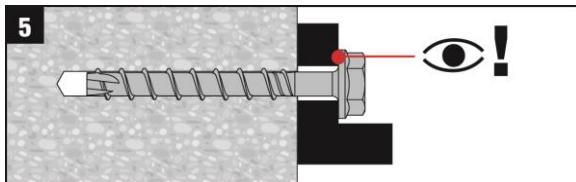

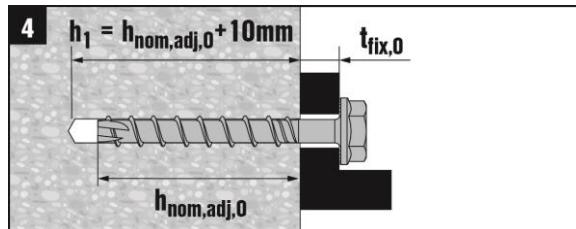

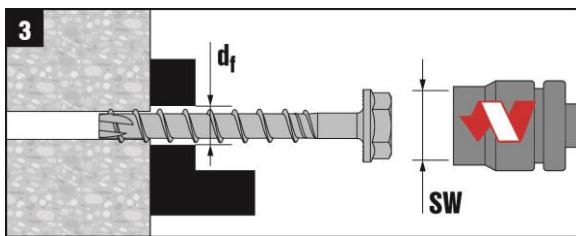

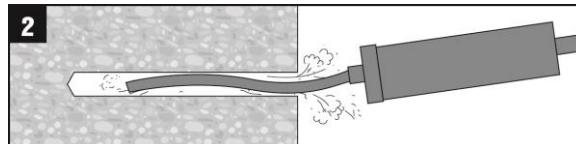

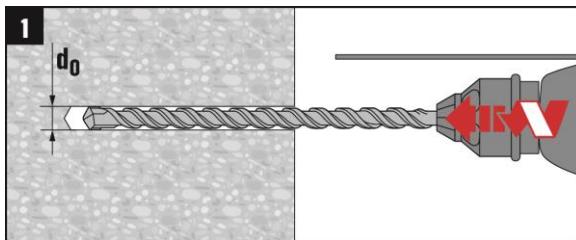

Install the screw anchor by impact screw driver Hilti SIW 22T-A

Ensure that the fixture is caught

For detailed information on installation see instruction for use given with the package of the product.

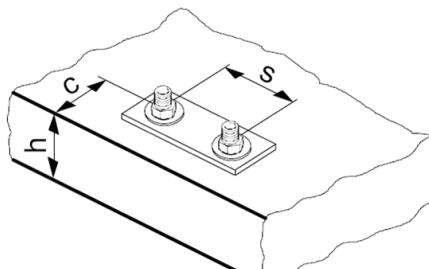

Setting instruction in case of adjustment process
 (recommended for HUS3-H,C size 8 and 10 for standard embedment depth h_{nom2} only)

For setting HUS3-H,C 8 ($h_{nom2}=60\text{mm}$) and HUS3-H,C 10 ($h_{nom2}=75\text{mm}$) it is allowed to adjust (loosening max. 10mm and re-tightening) the screw. The adjustment can be done maximum two times, $n_a=2$. The final embedment depth after adjustment process must be larger or equal than h_{nom2} . The total allowed thickness of shims added during the adjustment process $t_{adj}=10\text{mm}$.

Design parameters

Anchor size		8			10			14		
Type	HUS3	H, C			H, C, HF			H, HF		H
Nominal anchorage depth	h_{nom} [mm]	50	60	70	55	75	85	65	85	115
Effective anchorage depth	h_{ef} [mm]	40	46,4	54,9	41,6	58,6	67,1	49,3	66,3	91,8
Minimum base material thickness	h_{min} [mm]	100	100	120	100	130	140	120	160	200
Minimum spacing	s_{min} [mm]	40	50	50	50	50	60	60	75	75
Minimum edge distance	c_{min} [mm]	50	50	50	50	50	60	60	75	75
Critical spacing for splitting failure	$s_{\text{cr,sp}}$ [mm]	120	140	170	130	180	220	170	200	280
Critical edge distance for splitting failure	$c_{\text{cr,sp}}$ [mm]	60	70	85	65	90	110	85	100	140
Critical spacing for concrete cone failure	$s_{\text{cr,N}}$ [mm]	120	140	170	130	180	202	150	200	280
Critical edge distance for concrete cone failure	$c_{\text{cr,N}}$ [mm]	60	70	85	65	90	101	75	100	140

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced.

Simplified design method

Simplified version of the design method according ETAG 001, Annex C. Design resistance according ETA-13/1038, issue 2014-03-26 (HUS3-H and C types only).

- Influence of concrete strength
- Influence of edge distance
- Influence of spacing
- Valid for a group of two anchors. (The method may also be applied for anchor groups with more than two anchors or more than one edge. The influencing factors must then be considered for each edge distance and spacing. The calculated design loads are then conservative: They will be lower than the exact values according ETAG 001, Annex C. To avoid this, it is recommended to use the anchor design software PROFIS anchor).

The design method is based on the following simplification:

- No different loads are acting on individual anchors (no eccentricity)

The values are valid for one anchor.

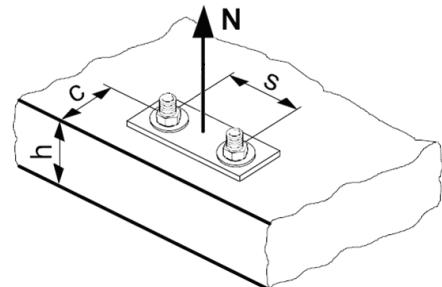

For more complex fastening applications please use the anchor design software PROFIS Anchor.

Tension loading

The design tensile resistance is the lower value of

- Steel resistance: $N_{Rd,s}$
- Concrete pull-out resistance: $N_{Rd,p} = N_{Rd,p}^0 \cdot f_B$
- Concrete cone resistance: $N_{Rd,c} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{re,N}$
- Concrete splitting resistance (only non-cracked concrete):

$$N_{Rd,sp} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,sp} \cdot f_{re,N}$$

Basic design tensile resistance

Influencing factors

Influence of concrete strength

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
Pull-out, concrete cone and splitting resistance							
$f_B = (f_{ck,cube}/25\text{N/mm}^2)^{1/2}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length.

Influence of edge distance ^{a)}

$c/c_{cr,N}$	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$c/c_{cr,sp}$										
$f_{1,N} = 0,7 + 0,3 \cdot c/c_{cr,N} \leq 1$	0,73	0,76	0,79	0,82	0,85	0,88	0,91	0,94	0,97	1
$f_{1,sp} = 0,7 + 0,3 \cdot c/c_{cr,sp} \leq 1$										
$f_{2,N} = 0,5 \cdot (1 + c/c_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{2,sp} = 0,5 \cdot (1 + c/c_{cr,sp}) \leq 1$										

a) The edge distance shall not be smaller than the minimum edge distance c_{min} given in the table with the setting details. These influencing factors must be considered for every edge distance.

Influence of anchor spacing ^{a)}

$s/s_{cr,N}$	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$f_{3,N} = 0,5 \cdot (1 + s/s_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{3,sp} = 0,5 \cdot (1 + s/s_{cr,sp}) \leq 1$										

- a) The anchor spacing shall not be smaller than the minimum anchor spacing s_{min} given in the table with the setting details. This influencing factor must be considered for every anchor spacing.

Influence of base material thickness

h/h_{min}	1,0	1,1	1,2	1,3	1,4	1,5	1,6	1,7	1,8	$\geq 1,84$
$f_{h,sp} = [h/(h_{min})]^{2/3}$	1	1,07	1,13	1,19	1,25	1,31	1,37	1,42	1,48	1,5

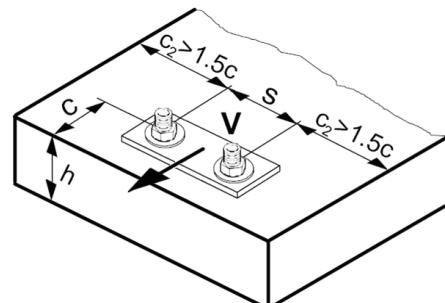

Influence of reinforcement ^{a)}

Anchor size	8			10			14		
	H, C, HF			H, C, HF			H, HF		
Nominal anchorage depth h_{nom} [mm]	50	60	70	55	75	85	65	85	115
$f_{re,N} = 0,5 + h_{eff}/200\text{mm} \leq 1$	0,70	0,73	0,77	0,71	0,79	0,84	0,75	0,83	0,96

- d) This factor applies only for dense reinforcement, If in the area of anchorage there is reinforcement with a spacing ≥ 150 mm (any diameter) or with a diameter ≤ 10 mm and a spacing ≥ 100 mm, then a factor $f_{re,N} = 1$ may be applied.

Shear loading
The design shear resistance is the lower value of

- Steel resistance: $V_{Rd,s}$
- Concrete prout resistance: $V_{Rd,cp} = k \cdot N_{Rd,c}$
- Concrete edge resistance: $V_{Rd,c}^0 = V_{Rd,c}^0 \cdot f_B \cdot f_B \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

$V_{Rd,c}^0$	[kN]	6,1	6,1	6,1	10,6	10,7				

c) For anchor groups only the anchors close to the edge must be considered.

Influencing factors

Influence of concrete strength

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25\text{ N/mm}^2)^{1/2}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length.

Influence of angle between load applied and the direction perpendicular to the free edge

Angle β		0°	10°	20°	30°	40°	50°	60°	70°	80°	≥ 90°
$f_\beta = \sqrt{\frac{1}{(\cos \alpha_v)^2 + \left(\frac{\sin \alpha_v}{2,5}\right)^2}}$		1	1,01	1,05	1,13	1,24	1,40	1,64	1,97	2,32	2,50

Influence of base material thickness

h/c	0,15	0,3	0,45	0,6	0,75	0,9	1,05	1,2	1,35	≥ 1,5
$f_h = \{h/(1,5 \cdot c)\}^{1/2} \leq 1$	0,32	0,45	0,55	0,63	0,71	0,77	0,84	0,89	0,95	1,00

Influence of anchor spacing and edge distance ^{a)} for concrete edge resistance: f_4

$$f_4 = (c/h_{\text{ef}})^{1,5} \cdot (1 + s / [3 \cdot c]) \cdot 0,5$$

c/h _{ef}	Single anchor	Group of two anchors s/h _{ef}														
		0,75	1,50	2,25	3,00	3,75	4,50	5,25	6,00	6,75	7,50	8,25	9,00	9,75	10,50	11,25
0,50	0,35	0,27	0,35	0,35	0,35	0,35	0,35	0,35	0,35	0,35	0,35	0,35	0,35	0,35	0,35	0,35
0,75	0,65	0,43	0,54	0,65	0,65	0,65	0,65	0,65	0,65	0,65	0,65	0,65	0,65	0,65	0,65	0,65
1,00	1,00	0,63	0,75	0,88	1,00	1,00	1,00	1,00	1,00	1,00	1,00	1,00	1,00	1,00	1,00	1,00
1,25	1,40	0,84	0,98	1,12	1,26	1,40	1,40	1,40	1,40	1,40	1,40	1,40	1,40	1,40	1,40	1,40
1,50	1,84	1,07	1,22	1,38	1,53	1,68	1,84	1,84	1,84	1,84	1,84	1,84	1,84	1,84	1,84	1,84
1,75	2,32	1,32	1,49	1,65	1,82	1,98	2,15	2,32	2,32	2,32	2,32	2,32	2,32	2,32	2,32	2,32
2,00	2,83	1,59	1,77	1,94	2,12	2,30	2,47	2,65	2,83	2,83	2,83	2,83	2,83	2,83	2,83	2,83

Fire resistance

Basic loading data for concrete C20/25 – C50/60

All data in this section applies to:

- Correct setting (see setting instruction)
- No edge distance and spacing influence
- Minimum base material thickness
- HUS3-H only.

The following technical data are based on: ETA-13/1038 issue 2014-09-19.

Recommended loads under fire exposure

Anchor size	HUS3 H	8			10			14		
		$h_{\text{nom}1}$	$h_{\text{nom}2}$	$h_{\text{nom}3}$	$h_{\text{nom}1}$	$h_{\text{nom}2}$	$h_{\text{nom}3}$	$h_{\text{nom}1}$	$h_{\text{nom}2}$	$h_{\text{nom}3}$

Concrete pry-out failure										
R30 to R120 k [-]		1,0	2,0	1,0				2,0		

- a) The recommended loads under fire exposure include a safety factor for resistance under fire exposure $\gamma_{M,\text{fi}} = 1,0$ and the partial safety factor for action $\gamma_{F,\text{fi}} = 1,0$. The partial safety factors for action shall be taken from national regulations.

Seismic design

Basic loading data for concrete C20/25 – C50/60

All data in this section applies to:

- Seismic design according to TR045
- HUS3-H and HUS3-C only

The following technical data are based on: ETA-13/1038 issue 2014-09-19.

Anchorage depth range

Anchor size	8	10	14
Type	HUS3	H, C	H, C
Nominal anchorage depth range h _{nom} [mm]	70	85	115

Tension resistance in case of seismic performance category C1

Anchor size	8	10	14
Type	HUS3	H, C	H, C
Characteristic tension resistance to steel failure			
N _{Rk,s,seis} [kN]	39,2	62,2	96,6
Partial safety factor γ _{Ms,seis} [-]		1,4	
Characteristic pull-out resistance in cracked concrete C20/25 to C50/60			
N _{Rk,p,seis} [kN]	12	19,8	31,7
Partial safety factor γ _{Mp,seis} [-]		1,5	
Concrete cone resistance and splitting resistance			
Partial safety factor γ _{Mc,seis} = γ _{Msp,seis} [-]		1,5	

Displacement under tension load in case of seismic performance category C1 ¹⁾

Anchor size	8	10	14
Type	HUS3	H, C	H, C
Displacement δ _{N,seis} [mm]	0,6	0,9	1,3

1) Maximum displacement during cycling (seismic event).

Shear resistance in case of seismic performance category C1 ¹⁾

Anchor size	8	10	14
Type	HUS3	H, C	H, C
Characteristic shear resistance to steel failure			
V _{Rk,s,seis} [kN]	11,9	16,8	22,5
Partial safety factor γ _{Ms,seis} [-]		1,5	
Concrete prout resistance and concrete edge resistance			
Partial safety factor γ _{Mc,seis} [-]		1,5	

1) Reduction factor α_{gap} = 1,0 when using the Hilti Dynamic Set

Displacement under tension load in case of seismic performance category C1 ¹⁾

Anchor size	8	10	14
Type	HUS3	H, C	H, C
Displacement δ _{V,seis} [mm]	5,3	4,3	5,5

1) Maximum displacement during cycling (seismic event)

Basic loading data for temporary application in standard and fresh concrete < 28 days old, $f_{ck,cube} \geq 10 \text{ N/mm}^2$:

All data in this section applies to the following conditions:

- Strength class, $f_{ck,cube} \geq 10 \text{ N/mm}^2$
- Only temporary use
- Screw is reusable, before each usage it must be checked according Hilti instruction for use with the suited tube Hilti HRG
- Design resistance and recommended load are valid for single anchor only
- Design resistance as well as the recommended load are valid for all load direction and valid for both cracked and non-cracked concrete
- Minimum base material thickness
- No edge distance and spacing influence
- Valid for HUS3-H only.

a) All data given in this section for HUS3-H sizes 10 and 14 according DIBt approval Z-21.8-2018 issue 2014-04-01

Design resistance

Anchor size HUS3-H	Hilti Tech. Data			DIBt approval Z-21.8-2018

**Instruction for use – re-use of screw****Basic loading data for single anchor in solid masonry units:**

All data in this section applies to the following conditions:

Solid bricks: a reduction of the cross section area by a vertical perforation perpendicular to the bed joint area must not be greater than 15%

Drilling:

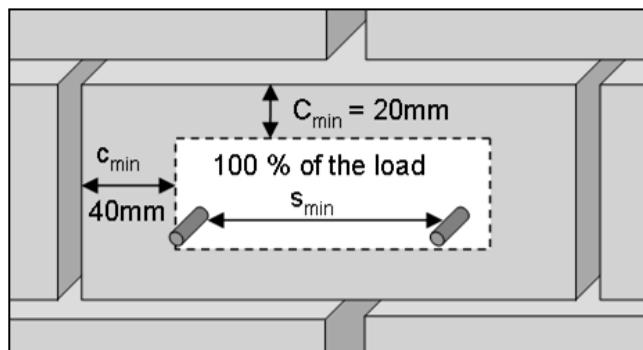

- Holes in Mz and KS drilled with TE rotary hammers drilled with hammering mode
- Holes in PPW drilled with TE rotary hammers drilled without hammering mode

Installation:

- The anchor is correctly mounted, if there is neither a turn-through or spinning of the screw in the drill hole nor that an easy turning of the screw is possible after the installation procedure when the head of the screw has touched the fixture
- The recommended setting tool is Hilti SFH 22A

Edge distance and spacing influences:

- Distance to free edge free edge to solid masonry (Mz and KS) units $c_{min,free} \geq 200$ mm
- Distance to free edge free edge to solid masonry (autoclaved aerated gas concrete) units $c_{min,free} \geq 170$ mm
- The minimum distance to horizontal and vertical mortar joint $c_{min,h}$ and $c_{min,v}$ is stated in drawing below
- Minimum anchor spacing in one brick/block is $s_{min} = 80$ mm

The minimum edge distance to vertical mortar joint for aerated gas concrete is 100mm,

Recommended loads

Base material	Anchor size	Hilti	
	Type	8	10
	h_{nom} [mm]	60	75
	Compressive strength class [N/mm ²] Tensile and Shear	F_{rec} ^{a)} [kN]	
Solid clay brick  Mz 2,0-2DF DIN V 105-100 / EN 771-1 l [mm]: 240x115x113 h _{min} [mm]: 115	≥ 12	1,1	1,4
Solid sand-lime brick  KS 2,0-2DF DIN V 106-100 / EN 771-2 LxWxH [mm]: 240x115x113 h _{min} [mm]: 115	≥ 12	1,3	1,4
Aerated concrete  PPW 6-0,4 DIN 4165 / EN 771-4 LxWxH [mm]: 499x240x249 h _{min} [mm]: 240	≥ 6	0,7	0,9

a) Characteristic resistance for tension, shear or combined tension and shear loading.

The characteristic resistance is valid for single anchor or for a group of two or four anchors with spacing equal or larger than the minimum spacing s_{min} according to specification.

Load values:

- The technical data for the HUS3 anchors are reference loads for MZ 12 2,0-2DF, KS 12 2,0-2DF and PPW 6-0,4.
- The load Values are valid for non-structural applications.
- Due to the natural variation of stone solid bricks, on site anchor testing is recommended to validate technical data.
- The HUS3 anchor was installed and tested in the center area of solid bricks as shown considering minimal edge and space distances.
- The HUS3 anchor was not tested in the mortar joint between solid bricks or in hollow bricks; however a load reduction is expected.
- For brick walls where anchor position in brick cannot be determined, 100% anchor testing is recommended.

Limitations of loads:

- All data is for redundant fastening for not structural applications
- Plaster, graveling, lining or leveling courses are regarded as non-bearing and may not be taken into account for the calculation of embedment depth,
- The decisive resistance to tension loads is the lower value of N_{rec} (brick breakout, pull out) and $N_{max,pb}$ (pull out of one brick),

Pull out of one brick:

The allowable load of an anchor or a group of anchors in case of single brick pull out, $N_{max,pb}$ [kN], is given in the following tables:

Clay bricks:

$N_{max,pb}$ [kN]		brick breadth b_{brick} [mm]					
		80	120	200	240	300	360
brick length l_{brick} [mm]	240	1,1	1,6	2,7	3,3	4,1	4,9
	300	1,4	2,1	3,4	4,1	5,1	6,2
	500	2,3	3,4	5,7	6,9	8,6	10,3

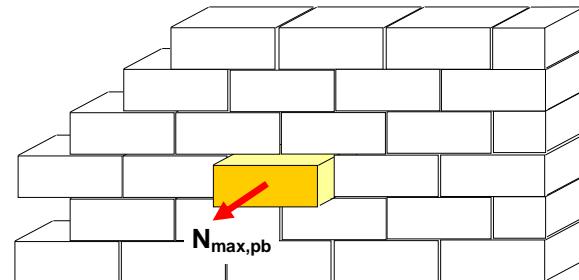

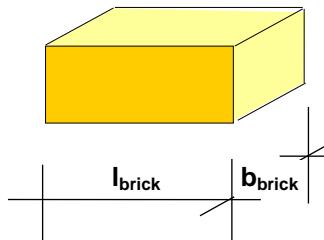

All other brick types:

$N_{max,pb}$ [kN]		brick breadth b_{brick} [mm]					
		80	120	200	240	300	360
brick length l_{brick} [mm]	240	0,8	1,2	2,1	2,5	3,1	3,7
	300	1,0	1,5	2,6	3,1	3,9	4,6
	500	1,7	2,6	4,3	5,1	6,4	7,7

$N_{max,pb}$ = resistance for pull out of one brick

l_{brick} = length of the brick

b_{brick} = breadth of the brick

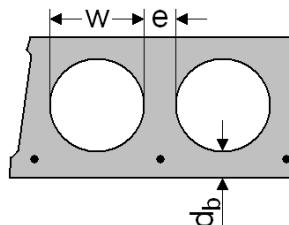

Basic loading data for single anchor in Hollow core slab:

Basic loading data

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Ratio core width / web thickness w/e $\leq 4,2$
- Concrete C 30/37 to C 50/60

Characteristic resistance

Anchor size	8	10
Type	HUS3	C, H
Bottom flange thickness	$d_b \geq$ [mm]	30
All load directions	F_{Rk} [kN]	2,0

Design resistance

Anchor size	8	10
Type	HUS3	C, H
Bottom flange thickness	$d_b \geq$ [mm]	30
All load directions	F_{Rd} [kN]	1,3

Recommended loads

Anchor size	8	10
Type	HUS3	C, H
Bottom flange thickness	$d_b \geq$ [mm]	30
All load directions ^{a)}	F_{rec} [kN]	0,95

- a) With overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Requirements for redundant fastening

The definition of redundant fastening according to Member States is given in the ETAG 001 Part six, Annex 1, In Absence of a definition by a Member State the following default values may be taken

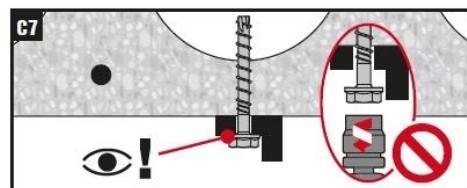

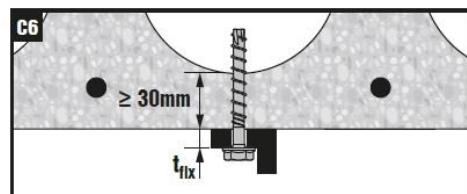

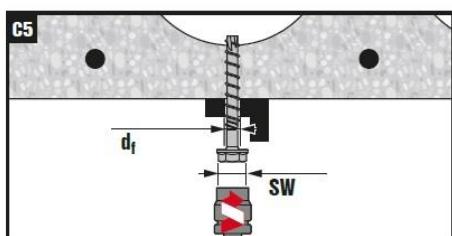

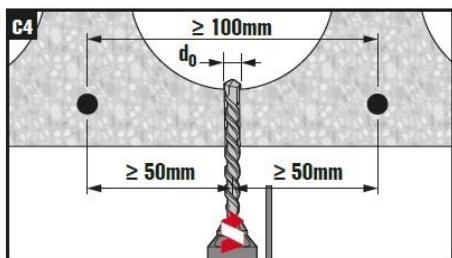

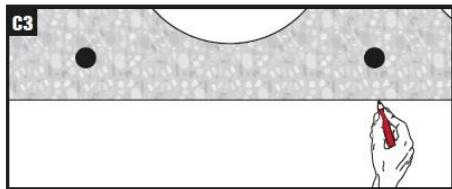

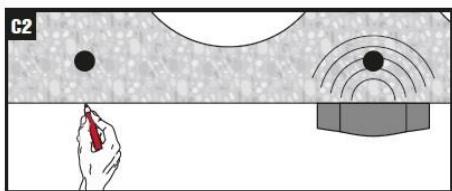

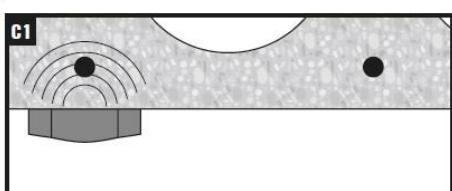

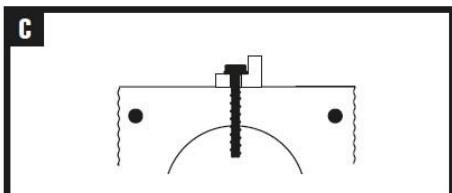

Minimum number of fixing points	Minimum number of anchors per fixing point	Maximum design load of action N_{sd} per fixing point ^{a)}
3	1	2 kN
4	1	3 kN

- a) The value for maximum design load of actions per fastening point N_{sd} is valid in general that means all fastening points are considered in the design of the redundant structural system. The value N_{sd} may be increased if the failure of one (= most unfavourable) fixing point is taken into account in the design (serviceability and ultimate limit state) of the structural system e.g. suspended ceiling.

a) Data for HUS-HR with standard and reduced embedment depth is given in this section according ETA-08/0307 issue 2014-04-29,

Basic loading data

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Concrete as specified in the table
- Steel failure
- Minimum base material thickness
- Concrete C 20/25, $f_{ck,cube} = 25 \text{ N/mm}^2$

For details see Simplified design method

b) Hilti does not recommend this setting process for this application,

c) Installation torque refer to HUS-HR only

Base material thickness, anchor spacing and edge distance

Anchor size			6		8			10			14	
Type			HUS-HR		HUS-HR			HUS-HR, CR			HUS-HR	
Nominal embedment depth	h_{nom}	[mm]	30	55	50	60	80	60	70	90	70	110
Minimum base material thickness non-cracked concrete	h_{min}	[mm]	100	100	100	100	120	120	120	140	140	160
Minimum spacing	s_{min}	[mm]	35	35	45	45	50	50	50	50	50	60
Minimum edge distance	c_{min}	[mm]	35	35	45	45	50	50	50	50	50	60
Critical spacing for concrete cone and splitting failure	$s_{\text{cr,N}} = s_{\text{cr,sp}}$	[mm]	69	135	114	141	192	166	194	256	187	310
Critical edge distance for concrete cone and splitting failure	$c_{\text{cr,N}} = c_{\text{cr,sp}}$	[mm]	35	68	57	71	96	83	97	128	94	155

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced (see system design resistance),

Critical spacing and critical edge distance for splitting failure apply only for non-cracked concrete. For cracked concrete only the critical spacing and critical edge distance for concrete cone failure are decisive,

Simplified design method

Simplified version of the design method according ETAG 001, Annex C, Design resistance according data given in ETA-08/0307 issue 2011,01,21,

- Influence of concrete strength
- Influence of edge distance
- Influence of spacing
- Valid for a group of two anchors, (The method may also be applied for anchor groups with more than two anchors or more than one edge, The influencing factors must then be considered for each edge distance and spacing, The calculated design loads are then on the safe side: They will be lower than the exact values according ETAG 001, Annex C, To avoid this, it is recommended to use the anchor design software PROFIS anchor)

The design method is based on the following simplification:

- No different loads are acting on individual anchors (no eccentricity)

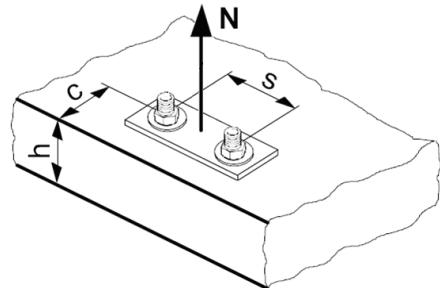

The values are valid for one anchor (single point fastening), multiple use applications are not part of this design method,

For more complex fastening applications please use the anchor design software PROFIS Anchor,

Tension loading

The design tensile resistance is the lower value of

- Steel resistance: $N_{Rd,s}$
- Concrete pull-out resistance: $N_{Rd,p} = N_{Rd,c}^0 \cdot f_B$
- Concrete cone resistance: $N_{Rd,c} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{re,N}$
- Concrete splitting resistance (only non-cracked concrete): $N_{Rd,sp} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{re,N}$

Basic design tensile resistance

$f_B = (f_{ck,cube}/25\text{N/mm}^2)^{0,5}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of edge distance ^{a)}

$c/c_{cr,N}$	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$c/c_{cr,sp}$										
$f_{1,N} = 0,7 + 0,3 \cdot c/c_{cr,N} \leq 1$	0,73	0,76	0,79	0,82	0,85	0,88	0,91	0,94	0,97	1
$f_{1,sp} = 0,7 + 0,3 \cdot c/c_{cr,sp} \leq 1$										
$f_{2,N} = 0,5 \cdot (1 + c/c_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{2,sp} = 0,5 \cdot (1 + c/c_{cr,sp}) \leq 1$										

- a) The edge distance shall not be smaller than the minimum edge distance c_{min} given in the table with the setting details, These influencing factors must be considered for every edge distance,

Influence of anchor spacing ^{a)}

$s/s_{cr,N}$	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$s/s_{cr,sp}$										
$f_{3,N} = 0,5 \cdot (1 + s/s_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{3,sp} = 0,5 \cdot (1 + s/s_{cr,sp}) \leq 1$										

- a) The anchor spacing shall not be smaller than the minimum anchor spacing s_{min} given in the table with the setting details, This influencing factor must be considered for every anchor spacing,

Influence of base material thickness

h/h_{ef}	2,0	2,2	2,4	2,6	2,8	3,0	3,2	3,4	3,6	$\geq 3,68$
$f_{h,sp} = [h/(2 \cdot h_{ef})]^{2/3}$	1	1,07	1,13	1,19	1,25	1,31	1,37	1,42	1,48	1,5

Influence of reinforcement

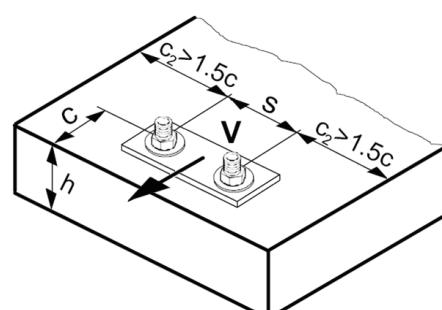

Anchor size	6		8			10			14		
Type	HUS	HR	HR			HR, CR			HR		
h_{nom}	[mm]	30	55	50	60	80	60	70	90	70	110
h_{ef}	[mm]	23	45	38	47	64	46	54	71	52	86
$f_{re,N} = 0,5 + h_{ef}/200\text{mm} \leq 1$		0,62	0,73	0,69	0,74	0,82	0,73	0,77	0,86	0,76	0,93

- a) This factor applies only for dense reinforcement, If in the area of anchorage there is reinforcement with a spacing ≥ 150 mm (any diameter) or with a diameter ≤ 10 mm and a spacing ≥ 100 mm, then a factor $f_{re,N} = 1$ may be applied,

Shear loading

The design shear resistance is the lower value of

- Steel resistance: $V_{Rd,s}$
- Concrete prout resistance: $V_{Rd,cp} = k \cdot N_{Rd,c}$
- Concrete edge resistance: $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_B \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

a) The edge distance shall not be smaller than the minimum edge distance c_{min} ,

Combined tension and shear loading

For combined tension and shear loading see section “Anchor Design”,

Precalculated values

Design resistance calculated according ETAG 001, Annex C and data given in ETA-08/0307, issue 2011,01,21, All data applies to concrete C 20/25 – $f_{ck,cube} = 25 \text{ N/mm}^2$, Hilti technical data for the extra reduced embedment depth is not part of the approval,

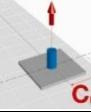

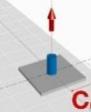

Recommended loads can be calculated by dividing the design resistance by an overall partial safety factor for action $\gamma = 1,4$, The partial safety factors for action depend on the type of loading and shall be taken from national regulations,

b) gThe recommended loads under fire exposure include a safety factor for resistance under fire exposure $\gamma_{M,\text{fi}} = 1,0$ and the partial safety factor for action $\gamma_{F,\text{fi}} = 1,0$. The partial safety factors for action shall be taken from national regulations,

Seismic design

Basic loading data for concrete C20/25 – C50/60

All data in this section applies to:

- Seismic design according to TR045

The following technical data are based on: ETA-08/0307 issue 2014-04-30

Anchorage depth range

Anchor size	8	10	14	
Type	HUS	HR	HR, CR	
Nominal anchorage depth range	h_{nom} [mm]	80	90	110

Tension resistance in case of seismic performance category C1

Anchor size	8	10	14
Type	HUS	HR	HR, CR
Characteristic tension resistance to steel failure			
$N_{Rk,s,\text{seis}}$ [kN]	34,0	52,6	102,2
Partial safety factor	$\gamma_{Ms,\text{seis}}$ [-]	1,4	
Characteristic pull-out resistance in cracked concrete C20/25 to C50/60			
$N_{Rk,p,\text{seis}}$ [kN]	7,7	12,5	17,5
Partial safety factor	$\gamma_{Mp,\text{seis}}$ [-]	1,8	
Concrete cone resistance and splitting resistance			
Partial safety factor	$\gamma_{Mc,\text{seis}} = \gamma_{Msp,\text{seis}}$ [-]	1,8	

Displacement under tension load in case of seismic performance category C1 ¹⁾

Anchor size	8	10	14	
Type	HUS	HR	HR, CR	
Displacement	$\delta_{N,\text{seis}}$ [mm]	1,2	1,2	0,4

1) Maximum displacement during cycling (seismic event),

Shear resistance in case of seismic performance category C1 ¹⁾

Anchor size	8	10	14
Type	HUS	HR	HR, CR
Characteristic shear resistance to steel failure			
$V_{Rk,s,\text{seis}}$ [kN]	11,1	17,9	53,9
Partial safety factor	$\gamma_{Ms,\text{seis}}$ [-]	1,5	
Concrete prout resistance and concrete edge resistance			
Partial safety factor	$\gamma_{Mc,\text{seis}}$ [-]	1,5	

1) Reduction factor $\alpha_{\text{gap}} = 1,0$ when using the Hilti Dynamic Set

Displacement under tension load in case of seismic performance category C1 ¹⁾

Anchor size	8	10	14	
Type	HUS	HR	HR, CR	
Displacement	$\delta_{V,\text{seis}}$ [mm]	4,8	5,3	7,6

1) Maximum displacement during cycling (seismic event)

Basic loading data for single anchor in solid masonry units

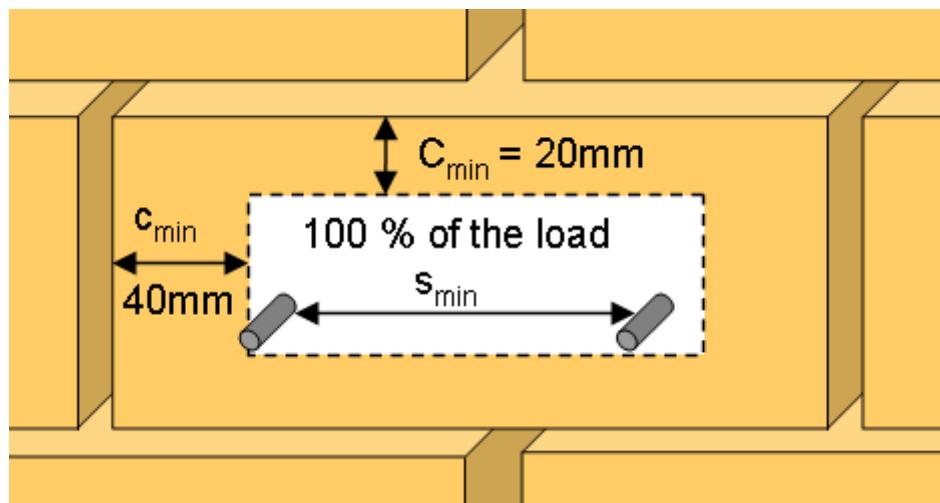

All data in this section applies to

- Load values valid for holes drilled with TE rotary hammers in hammering mod
- Correct anchor setting (see instruction for use, setting details)
- The core / material ratio may not exceed 15% of a bed joint area,
- The brim area around holes must be at least 70mm
- Edge distances, spacing and other influences, see below

Recommended loads

		Hilti		
Base material		Anchor size	6	8
		Type	HUS-HR	HUS-HR
Germany, Austria, Switzerland		h_{nom} [mm]	55	60
Solid clay brick Mz12/2,0 	DIN 105/ EN 771-1 f_b a) $\geq 12 \text{ N/mm}^2$	Tensile N_{rec} [kN]	0,9	1,0
		Shear V_{rec} [kN]	1,4	2,0
Solid sand-lime brick KS 12/2,0 	DIN 106/ EN 771-2 f_b a) $\geq 12 \text{ N/mm}^2$	Tensile N_{rec} [kN]	0,6	0,6
		Shear V_{rec} [kN]	0,9	1,1
Aerated concrete PPW 6-0,4 	DIN 4165/ EN 771-4 f_b a) $\geq 6 \text{ N/mm}^2$	Tensile N_{rec} [kN]	0,2	0,2
		Shear V_{rec} [kN]	0,4	0,4

a) f_b = brick strength

Permissible anchor location in brick and block walls**Edge distance and spacing influences**

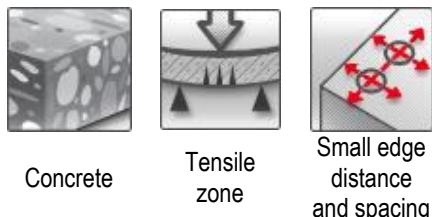

- The technical data for the HUS-HR anchors are reference loads for MZ 12 and KS 12. Due to the large variation of natural stone solid bricks, on site anchor testing is recommended to validate technical data,
- The HUS-HR anchor was installed and tested in center of solid bricks as shown, The HUS-HR anchor was not tested in the mortar joint between solid bricks or in hollow bricks; however a load reduction is expected,
- For brick walls where anchor position in brick can not be determined, 100% anchor testing is recommended,
- Distance to free edge free edge to solid masonry (Mz and KS) units $\geq 200\text{ mm}$
- Distance to free edge free edge to solid masonry (autoclaved aerated gas concrete) units $\geq 170\text{ mm}$
- The minimum distance to horizontal and vertical mortar joint (c_{min}) is stated in drawing above,
- Minimum anchor spacing (s_{min}) in one brick/block is $\geq 2*c_{min}$

Limits

- Applied load to individual bricks may not exceed 1,0 kN without compression or 1,4 kN with compression
- All data is for multiple use for non structural applications
- Plaster, graveling, lining or levelling courses are regarded as non-bearing and may not be taken into account for the calculation of embedment depth,

HUS-V Screw anchor

Anchor version	Benefits
 HUS-V 8 / 10 Carbon steel concrete screw with hexagonal head	<ul style="list-style-type: none"> - High productivity – less drilling and fewer operations than with conventional anchors - Technical data for cracked and non-cracked concrete - Technical data for reusability in fresh concrete ($f_{ck,cube}=10/15/20 \text{ Nmm}^2$) for temporary applications - Two embedment depths for maximum design flexibility

Basic loading data (for a single anchor)

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Steel failure
- Minimum base material thickness
- Cracked and non-cracked Concrete C 20/25, $f_{ck,cube} = 25 \text{ N/mm}^2$
- Adjustment allowed during the installation for size 8 and 10, h_{nom2} only.

For details see Simplified design method

Mean ultimate resistance

Anchor size	HUS-V	8		10	
Nominal embedment depth	h_{nom} [mm]	50	65	55	75
Non-cracked concrete					
Tensile $N_{Ru,m}$	[kN]	11,9	21,2	11,9	26,6
Shear $V_{Ru,m}$	[kN]	16,4	16,7	18,6	20,5
Cracked concrete

Setting details for concrete

Anchor size	HUS-V	8	10
Nominal anchorage depth h_{nom} [mm]		50	65
Nominal diameter of drill bit d_o [mm]		8	10
Cutting diameter of drill bit $d_{\text{cut}} \leq$ [mm]		8,45	10,45
Depth of drill hole $h_1 \geq$ [mm]		60	75
Diameter of clearance hole in the fixture $d_f \leq$ [mm]		12	14
Width across SW [mm]		13	15
Impact screw driver		Hilti SIW 22 T-A or SIW 22-A	

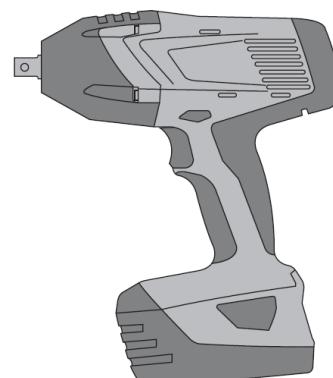

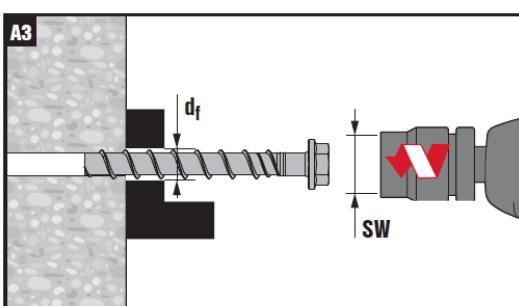

Setting instruction

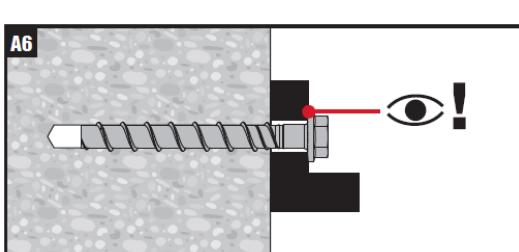

Make a cylindrical hole

Clean the borehole

Install the screw anchor by impact screw driver Hilti SIW 22T-A or SIW22-A

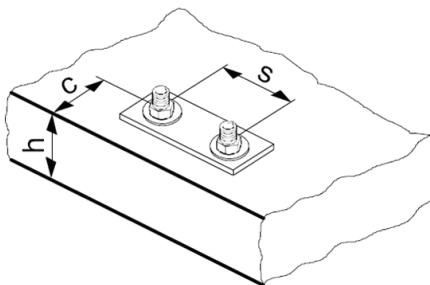

Ensure that the fixture is caught

For detailed information on installation see instruction for use given with the package of the product.

Design parameters

Anchor size	HUS-V	8		10	
Nominal anchorage depth	h_{nom} [mm]	50	65	55	75
Effective anchorage depth	h_{ef} [mm]	39,1	51,9	42,5	59,5
Minimum base material thickness	h_{min} [mm]	100	110	100	130
Minimum spacing	s_{min} [mm]	40	50	50	50
Minimum edge distance	c_{min} [mm]	50	50	50	50
Critical spacing for splitting failure	$s_{\text{cr,sp}}$ [mm]	117,3	140	130	180
Critical edge distance for splitting failure	$c_{\text{cr,sp}}$ [mm]	58,65	70	65	90
Critical spacing for concrete cone failure	$s_{\text{cr,N}}$ [mm]	117,3	177,3	127,5	178,5
Critical edge distance for concrete cone failure	$c_{\text{cr,N}}$ [mm]	58,65	88,65	63,75	89,25

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced,

Simplified design method

Simplified version of the design method according ETAG 001, Annex C,

- Influence of concrete strength
- Influence of edge distance
- Influence of spacing
- Valid for a group of two anchors, (The method may also be applied for anchor groups with more than two anchors or more than one edge, The influencing factors must then be considered for each edge distance and spacing, The calculated design loads are then conservative: They will be lower than the exact values according ETAG 001, Annex C.

The design method is based on the following simplification:

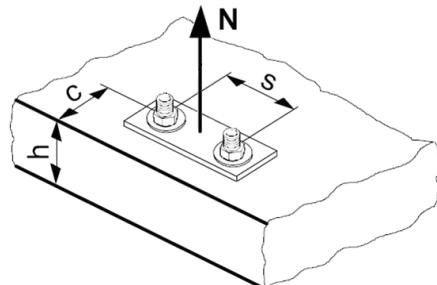

- No different loads are acting on individual anchors (no eccentricity)

The values are valid for one anchor,

Tension loading

The design tensile resistance is the lower value of

- Steel resistance: $N_{Rd,s}$
- Concrete pull-out resistance: $N_{Rd,p} = N^0_{Rd,p} \cdot f_B$
- Concrete cone resistance: $N_{Rd,c} = N^0_{Rd,c} \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{re,N}$
- Concrete splitting resistance (only non-cracked concrete):
 $N_{Rd,sp} = N^0_{Rd,c} \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,sp} \cdot f_{re,N}$

Basic design tensile resistance

Design steel resistance $N_{Rd,s}$

Anchor size	HUS-V	8	10
$N_{Rd,s}$	[kN]	25	30,3

Design pull-out resistance $N_{Rd,p} = N^0_{Rd,p} \cdot f_B$

Anchor size	HUS-V	8	10
Nominal anchorage depth h_{nom} [mm]		50	65
Non-cracked concrete			
$N^0_{Rd,p}$ [kN]		5	8,9
Cracked concrete			
$N^0_{Rd,p}$ [kN]		2,2	5
			3,3
			7,6

Design concrete cone resistance $N_{Rd,c} = N^0_{Rd,c} \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{re,N}$

Design splitting resistance ^{a)} $N_{Rd,sp} = N^0_{Rd,c} \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,sp} \cdot f_{re,N}$

Anchor size	HUS-V	8	10
Nominal anchorage depth h_{nom} [mm]		50	65
Non-cracked concrete			
$N^0_{Rd,c}$ [kN]		6,9	10,5
Cracked concrete			
$N^0_{Rd,c}$ [kN]		4,9	7,5
			5,5
			7,9

Influencing factors

Influence of concrete strength

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
Pull-out, concrete cone and splitting resistance							
$f_B = (f_{ck,cube}/25N/mm^2)^{1/2}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of edge distance a)

c/c _{cr,N}	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$f_{1,N} = 0,7 + 0,3 \cdot c/c_{cr,N} \leq 1$	0,73	0,76	0,79	0,82	0,85	0,88	0,91	0,94	0,97	1
$f_{1,sp} = 0,7 + 0,3 \cdot c/c_{cr,sp} \leq 1$										
$f_{2,N} = 0,5 \cdot (1 + c/c_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{2,sp} = 0,5 \cdot (1 + c/c_{cr,sp}) \leq 1$										

a) The edge distance shall not be smaller than the minimum edge distance c_{min} given in the table with the setting details, These influencing factors must be considered for every edge distance,

Influence of anchor spacing a)

s/s _{cr,N}	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$f_{3,N} = 0,5 \cdot (1 + s/s_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{3,sp} = 0,5 \cdot (1 + s/s_{cr,sp}) \leq 1$										

a) The anchor spacing shall not be smaller than the minimum anchor spacing s_{min} given in the table with the setting details, This influencing factor must be considered for every anchor spacing,

Influence of base material thickness

h/h _{min}	1,0	1,1	1,2	1,3	1,4	1,5	1,6	1,7	1,8	≥ 1,84
$f_{h,sp} = [h/(h_{min})]^{2/3}$	1	1,07	1,13	1,19	1,25	1,31	1,37	1,42	1,48	1,5

Influence of reinforcement a)

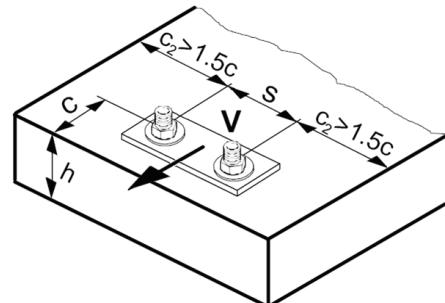

Anchor size	8		10	
Type	HUS-V			
Nominal anchorage depth h_{nom} [mm]	50		65	
$f_{re,N} = 0,5 + h_{ef}/200mm \leq 1$	0,70	0,76	0,71	0,80

e) This factor applies only for dense reinforcement, If in the area of anchorage there is reinforcement with a spacing ≥ 150 mm (any diameter) or with a diameter ≤ 10 mm and a spacing ≥ 100 mm, then a factor $f_{re,N} = 1$ may be applied,

Shear loading

The design shear resistance is the lower value of

- Steel resistance: $V_{Rd,s}$
- Concrete prout resistance: $V_{Rd,cp} = k \cdot N_{Rd,c}$
- Concrete edge resistance: $V_{Rd,c}^0 = V_{Rd,c}^0 \cdot f_B \cdot f_B \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Basic design shear resistance

Design steel resistance $V_{Rd,s}$

Anchor size	HUS-V	8	10
$V_{Rd,s}$	[kN]	10,6	13

Design concrete prout resistance $V_{Rd,cp} = k \cdot N_{Rd,c}$ ^{a)}

Anchor size	HUS-V	8	10
Nominal anchorage depth	h_{nom} [mm]	50	65
k		1	2

a) $N_{Rd,c}$: Design concrete cone resistance

Design concrete edge resistance $V_{Rd,c}^0 = V_{Rd,c}^0 \cdot f_B \cdot f_B \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Anchor size	HUS-V	8	10
Nominal anchorage depth	h_{nom} [mm]	50	65
Non-cracked concrete			
$V_{Rd,c}^0$	[kN]	5,0	5,0
		7,2	6,2
Cracked concrete			
$V_{Rd,c}^0$	[kN]	3,5	3,5
		5,1	4,4

d) For anchor groups only the anchors close to the edge must be considered,

Influencing factors

Influence of concrete strength

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25\text{N/mm}^2)^{1/2}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of angle between load applied and the direction perpendicular to the free edge

Angle β		0°	10°	20°	30°	40°	50°	60°	70°	80°	$\geq 90^\circ$
$f_\beta = \sqrt{\frac{1}{(\cos \alpha_V)^2 + \left(\frac{\sin \alpha_V}{2,5}\right)^2}}$		1	1,01	1,05	1,13	1,24	1,40	1,64	1,97	2,32	2,50

Influence of base material thickness

h/c	0,15	0,3	0,45	0,6	0,75	0,9	1,05	1,2	1,35	$\geq 1,5$
$f_h = \{h/(1,5 \cdot c)\}^{1/2} \leq 1$	0,32	0,45	0,55	0,63	0,71	0,77	0,84	0,89	0,95	1,00

Influence of anchor spacing and edge distance ^{a)} for concrete edge resistance: f_4

$$f_4 = (c/h_{\text{ef}})^{1,5} \cdot (1 + s / [3 \cdot c]) \cdot 0,5$$

c/h _{ef}	Single anchor	Group of two anchors s/h _{ef}

Basic loading data for temporary application in standard and fresh concrete < 28 days old, $f_{ck,cube} \geq 10 \text{ N/mm}^2$:

All data in this section applies to the following conditions:

- Strength class, $f_{ck,cube} \geq 10 \text{ N/mm}^2$
- Only temporary use
- Screw is reusable, before each usage it must be checked according Hilti instruction for use with the suited tube Hilti HRG
- Design resistance and recommended load are valid for single anchor only
- Design resistance as well as the recommended load are valid for all load direction and valid for both cracked and non-cracked concrete
- Minimum base material thickness
- No edge distance and spacing influence

Basic loading data for concrete C20/25

All data in this section applies to

- Correct setting (see setting instruction)
- No edge distance and spacing influence
- Steel failure
- Minimum base material thickness
- Concrete C 20/25, $f_{ck,cube} = 25 \text{ N/mm}^2$

For details see simplified design method

The following technical data are based on:

ETA: Data according ETA-08/0307 issue 2014-04-29

Hilti: Additional Hilti technical data

Mean ultimate resistance

Basic loading data for concrete < 28 days old and $f_{ck,cube} \geq 15 \text{ N/mm}^2$:**All data in this section applies to the following conditions:****Concrete:**

- Strength class C 20/25, $f_{ck,cube} \geq 15 \text{ N/mm}^2$

Installation:

- For hand installation $T_{inst,rec} = 40 \text{ Nm}$

The anchor is correctly mounted, if there is neither a turn-through or spinning of the screw in the drill hole nor that an easy turning of the screw is possible after the installation procedure when the head of the screw has touched the fixture.

Loads:

- No edge distance and spacing influence
- Minimum base material thickness

Recommended loads in non-cracked concrete

	Hilti		
Anchor size	14	14	14
Type	HUS-	H	H
h_{nom} [mm]	70	90	110
Non-cracked concrete			
Tensile N_{rec} ^{a)} [kN]	3,5	5,5	7,5
Shear V_{rec} ^{a)} [kN]	6,6	14,0	16,5

a) Values serve as a reference, onsite testing is recommended to determine actual loading potential of the anchors

Basic loading data for single anchor in solid masonry units:**All data in this section applies to the following conditions:**

Solid bricks: a reduction of the cross section area by a vertical perforation perpendicular to the bed joint area must not be greater than 15%

Drilling:

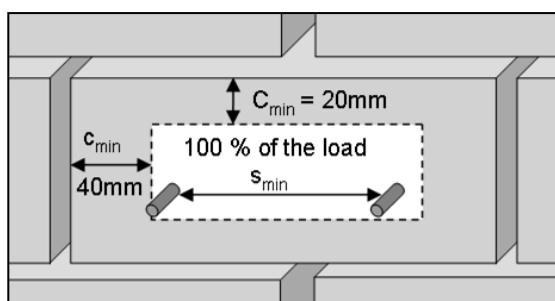

- Holes in Mz and KS drilled with TE rotary hammers drilled with hammering mode
- Holes in PPW drilled with TE rotary hammers drilled without hammering mode

Installation:

- The anchor is correctly mounted, if there is neither a turn-through or spinning of the screw in the drill hole nor that an easy turning of the screw is possible after the installation procedure when the head of the screw has touched the fixture

Edge distance and spacing influences:

- Distance to free edge free edge to solid masonry (Mz and KS) units $c_{min,free} \geq 200 \text{ mm}$
- Distance to free edge free edge to solid masonry (autoclaved aerated gas concrete) units $c_{min,free} \geq 170 \text{ mm}$
- The minimum distance to horizontal and vertical mortar joint $c_{min,h}$ and $c_{min,v}$ is stated in drawing below
- Minimum anchor spacing in one brick/block is $s_{min} = 80 \text{ mm}$

Recommended loads

Base material	Anchor size	6	8	10	
	Type	HUS-	A, H, I, P	H	
	h_{nom}	[mm]	55	60	70
	Compressive strength class	$F_{rec}^{a)} [kN]$ Tensile and Shear			
Solid clay brick  Mz 2,0-2DF DIN V 105-100 / EN 771-1 LxWxH [mm]: 240x115x113 h_{min} [mm]: 115	≥ 8	0,6	0,8	1,0	
	≥ 10	0,7	0,9	1,2	
	≥ 12	0,8	1,0	1,3	
	≥ 16	0,9	1,2	1,5	
	≥ 20	0,9	1,3	1,7	
Solid sand-lime brick  KS 2,0-2DF DIN V 106-100 / EN 771-2 LxWxH [mm]: 240x115x113 h_{min} [mm]: 115	≥ 8	0,8	1,0	1,1	
	≥ 10	0,9	1,1	1,2	
	≥ 12	1,0	1,2	1,3	
	≥ 16	1,1	1,3	1,5	
	≥ 20	1,2	1,5	1,7	
Aerated concrete  PPW -0,65 DIN 4165/ EN 771-4 LxWxH [mm]: 499x240x249 h_{min} [mm]: 240	≥ 6	0,4	0,5	1,3	

a) Characteristic resistance for tension, shear or combined tension and shear loading.

The characteristic resistance is valid for single anchor or for a group of two or four anchors with a spacing equal or larger than the minimum spacing s_{min} according to specification.

Load values:

- The technical data for the HUS-H anchors are reference loads for MZ 12 2,0-2DF, KS 12 2,0-2DF and PPW 6-0,65.
- The load Values are valid for non-structural applications.
- Due to the natural variation of stone solid bricks, on site anchor testing is recommended to validate technical data.
- The HUS-H anchor was installed and tested in the centre area of solid bricks as shown considering minimal edge and space distances.
- The HUS-H anchor was not tested in the mortar joint between solid bricks or in hollow bricks; however a load reduction is expected.
- For brick walls where anchor position in brick can not be determined, 100% anchor testing is recommended.

Limitations of loads:

- All data is for redundant fastening for non structural applications
- Plaster, graveling, lining or leveling courses are regarded as non-bearing and may not be taken into account for the calculation of embedment depth.
- The decisive resistance to tension loads is the lower value of N_{rec} (brick breakout, pull out) and $N_{max,pb}$ (pull out of one brick).

Pull out of one brick:

The allowable load of an anchor or a group of anchors in case of single brick pull out, $N_{max,pb}$ [kN], is given in the following tables:

Clay bricks:

$N_{max,pb}$ [kN]		brick breadth b_{brick} [mm]					
		80	120	200	240	300	360
brick length l_{brick} [mm]	240	1,1	1,6	2,7	3,3	4,1	4,9
	300	1,4	2,1	3,4	4,1	5,1	6,2
	500	2,3	3,4	5,7	6,9	8,6	10,3

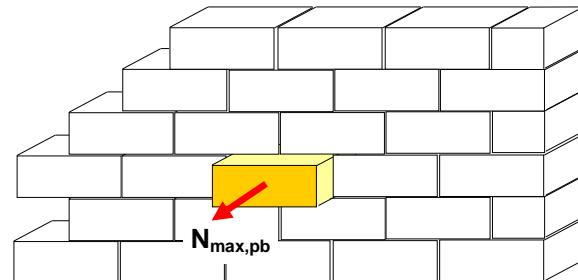

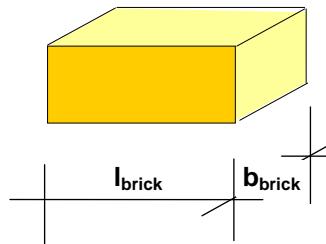

All other brick types:

$N_{max,pb}$ [kN]		brick breadth b_{brick} [mm]					
		80	120	200	240	300	360
brick length l_{brick} [mm]	240	0,8	1,2	2,1	2,5	3,1	3,7
	300	1,0	1,5	2,6	3,1	3,9	4,6
	500	1,7	2,6	4,3	5,1	6,4	7,7

$N_{max,pb}$ = resistance for pull out of one brick

l_{brick} = length of the brick

b_{brick} = breadth of the brick

Setting instruction

For detailed information on installation see instruction for use given with the package of the product.

Base material thickness, anchor spacing and edge distance for concrete from C20/25 to C50/60

Anchor size		6	8			10			14		
Type	HUS-	A, I, H, P	H			H			H		
h_{nom}	[mm]	55	50	60	75	60	70	85	70	90	110
Minimum base material thickness	h_{min} [mm]	100	100	110	120	110	130	130	130	170	210
non-cracked concrete	Minimum spacing s_{min} [mm]	35	55			65			80		
cracked concrete	Minimum edge distance c_{min} [mm]	35	55			65			60		
Effective anchorage depth	h_{ef} [mm]	42	36	47	60	44	54	67	50	69	90
Critical spacing for concrete cone failure	$s_{\text{cr,N}}$ [mm]	3 h_{ef}									
Critical spacing for splitting failure	$s_{\text{cr,sp}}$ [mm]										
Critical edge distance for concrete cone failure	$c_{\text{cr,N}}$ [mm]	1,5 h_{ef}									
Critical edge distance for splitting failure	$c_{\text{cr,sp}}$ [mm]										

For spacing and/ or edge distance smaller than critical spacing and/ or critical edge distance the design loads have to be reduced.

Critical spacing and critical edge distance for splitting failure apply only for non-cracked concrete. For cracked concrete only the critical spacing and critical edge distance for concrete cone failure are decisive.

Simplified design method

Simplified version of the design method according ETAG 001, Annex C. Design resistance according data given in ETA-08/0307 issue 2014-04-29.

- Influence of concrete strength
- Influence of edge distance
- Influence of spacing
- Valid for a group of two anchors. (The method may also be applied for anchor groups with more than two anchors or more than one edge. The influencing factors must then be considered for each edge distance and spacing. The calculated design loads are then on the save side: They will be lower than the exact values according ETAG 001, Annex C. To avoid this, it is recommended to use the anchor design software PROFIS anchor)

The design method is based on the following simplification:

- No different loads are acting on individual anchors (no eccentricity)

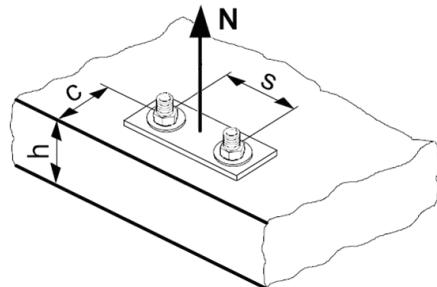

The values are valid for one anchor.

For more complex fastening applications please use the anchor design software PROFIS Anchor.

Tension loading

The design tensile resistance is the lower value of

- Steel resistance: $N_{Rd,s}$
- Concrete pull-out resistance: $N_{Rd,p} = N^0_{Rd,p} \cdot f_B$
- Concrete cone resistance: $N_{Rd,c} = N^0_{Rd,c} \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{re,N}$
- Concrete splitting resistance (only non-cracked concrete):
For HUS-A, H, I, P $N_{Rd,sp} = N^0_{Rd,p} \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,sp} \cdot f_{re,N}$
For all the other HUS $N_{Rd,sp} = N^0_{Rd,c} \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,sp} \cdot f_{re,N}$

Basic design tensile resistance

Design steel resistance $N_{Rd,s}$

	ETA-08/0307				Hilti		
Anchor size	HUS-A, H, I, P		HUS-H 8		HUS-H 10		HUS-H 14
$N_{Rd,s}$ [kN]	16,7		26,5		39,6		67,5

ETA: Data according ETA-08/0307 issue 2014-04-29 Hilti: Additional Hilti technical data

Design pull-out resistance $N_{Rd,p} = N^0_{Rd,p} \cdot f_B$

Non-cracked concrete										
Tensile $N^0_{Rd,c}$ [kN]	7,6	9,0	13,0	11,1	13,2	6,0	8,2	11,9	18,4	28,7
Cracked concrete										
Tensile $N^0_{Rd,c}$ [kN]	5,4	6,4	9,3	7,9	9,4	4,3	5,8	-	13,2	-

a) Splitting resistance must only be considered for non-cracked concrete

b) Equation valid for HUS-A, H, I, P 6

ETA: Data according ETA-08/0307 issue 2014-04-29 Hilti: Additional Hilti technical data

Influencing factors**Influence of concrete strength**

Concrete strength designation (ENV 206)	HUS	h_{nom}	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,\text{cube}}/25\text{N/mm}^2)^{0,5}$ a)	6	55	1	1,10	1,22	1,34	1,41	1,48	1,55
	8	50...75							
	10	85							
	14	70...110							
$f_B = (f_{ck,\text{cube}}/25\text{N/mm}^2)^{0,4}$ a)	10	60...70	1	1,08	1,17	1,27	1,32	1,37	1,42

a) $f_{ck,\text{cube}}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of edge distance a)

$c/c_{cr,N}$	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$c/c_{cr,sp}$										
$f_{1,N} = 0,7 + 0,3 \cdot c/c_{cr,N} \leq 1$	0,73	0,76	0,79	0,82	0,85	0,88	0,91	0,94	0,97	1
$f_{1,sp} = 0,7 + 0,3 \cdot c/c_{cr,sp} \leq 1$										
$f_{2,N} = 0,5 \cdot (1 + c/c_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{2,sp} = 0,5 \cdot (1 + c/c_{cr,sp}) \leq 1$										

a) The edge distance shall not be smaller than the minimum edge distance c_{\min} given in the table with the setting details. These influencing factors must be considered for every edge distance.

Influence of anchor spacing a)

$s/s_{cr,N}$	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$s/s_{cr,sp}$										
$f_{3,N} = 0,5 \cdot (1 + s/s_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{3,sp} = 0,5 \cdot (1 + s/s_{cr,sp}) \leq 1$										

a) The anchor spacing shall not be smaller than the minimum anchor spacing s_{\min} given in the table with the setting details. This influencing factor must be considered for every anchor spacing.

Influence of base material thickness

h/h_{ef}	2,0	2,2	2,4	2,6	2,8	3,0	3,2	3,4	3,6	$\geq 3,68$
$f_{h,sp} = [h/(2 \cdot h_{\text{ef}})]^{2/3}$	1	1,07	1,13	1,19	1,25	1,31	1,37	1,42	1,48	1,5

Influence of reinforcement

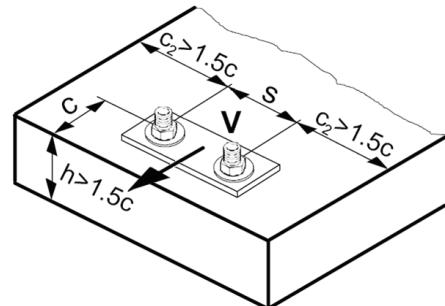

Anchor size	6		8			10			14		
Type	HUS-	A, H, I, P	H			H			H		
h_{nom}	[mm]	55	50	60	75	60	70	85	70	90	110
h_{ef}	[mm]	42	36	46,9	59,6	44	52,7	66,8	50	67	90
$f_{re,N}$ a) = $0,5 + h_{\text{ef}}/200\text{mm} \leq 1$		0,71	0,68	0,73	0,8	0,72	0,76	0,83	0,7	0,84	0,95

a) This factor applies only for dense reinforcement. If in the area of anchorage there is reinforcement with a spacing ≥ 150 mm (any diameter) or with a diameter ≤ 10 mm and a spacing ≥ 100 mm, then a factor $f_{re,N} = 1$ may be applied.

Shear loading

The design shear resistance is the lower value of

- Steel resistance: $V_{Rd,s}$
- Concrete prout resistance: $V_{Rd,cp} = V_{Rd,cp}^0 \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{re,N}$
- Concrete edge resistance: $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_{\beta} \cdot f_h \cdot f_4$

- a) The anchor spacing and the edge distance shall not be smaller than the minimum anchor spacing s_{min} and the minimum edge distance c_{min} .

Combined tension and shear loading

For combined tension and shear loading see section "Anchor Design".

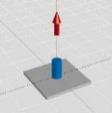

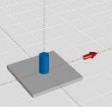

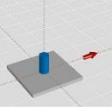

Precalculated values

Design resistance calculated according ETAG 001, Annex C and data given in ETA-08/0307 issue 2014-04-29.
 All data applies to concrete C 20/25 – $f_{ck,cube} = 25 \text{ N/mm}^2$.

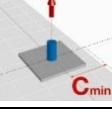

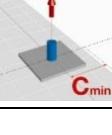

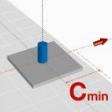

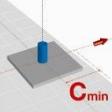

Recommended loads can be calculated by dividing the design resistance by an overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Design resistance

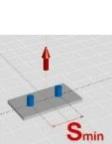

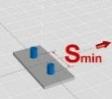

Single anchor, no edge effects

a) Data for HUS-HR 6 with nominal embedment depth = 30 mm for multiple use for non-structural applications (= redundant fastening) are not part of ETA-10/0005 issue 2013-06-26

Basic loading data

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Concrete C 20/25, $f_{ck,cube} = 25 \text{ N/mm}^2$

For details see Simplified design method

The following technical data are based on:

ETA: Data according ETA-05/0005 issue 2013-06-26

Hilti: Additional Hilti technical data

Characteristic resistance

			Hilti tech. data	Data according ETA-10/0005, issue 2013-06-26	
Anchor version			HUS-HR 6		HUS-A, -H, -I, -P 6
Nominal embedment depth	h_{nom}	[mm]	30	35	35
All load directions	$35 \leq c < 80 \text{ mm}$	F_{Rk}^0 [kN]	2,0	3,0	2,0
	$c \geq 80 \text{ mm}$	F_{Rk}^0 [kN]		5,0	3,0

Design resistance

			Hilti tech. data	Data according ETA-10/0005, issue 2013-06-26	
Anchor version			HUS-HR 6		HUS-A, -H, -I, -P 6
Nominal embedment depth	h_{nom}	[mm]	30	35	35
All load directions	$35 \leq c < 80 \text{ mm}$	F_{Rd}^0 [kN]	1,0	1,4	1,3
	$c \geq 80 \text{ mm}$	F_{Rd}^0 [kN]		2,4	2,0

Recommended loads

			Hilti tech. data	Data according ETA-10/0005, issue 2013-06-26	
Anchor version			HUS-HR 6		HUS-A, -H, -I, -P 6
Nominal embedment depth	h_{nom}	[mm]	30	35	35
All load directions ^{a)}	$35 \leq c < 80 \text{ mm}$	F_{Rec}^0 [kN]	0,7	1,0	0,9
	$c \geq 80 \text{ mm}$	F_{Rec}^0 [kN]		1,7	1,4

- a) With overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Requirements for redundant fastening

The definition of redundant fastening according to Member States is given in the ETAG 001 Part six, Annex 1. In Absence of a definition by a Member State the following default values may be taken

Minimum number of fixing points	Minimum number of anchors per fixing point	Maximum design load of action N_{sd} per fixing point ^{a)}
3	1	2 kN
4	1	3 kN

- b) The value for maximum design load of actions per fastening point N_{sd} is valid in general that means all fastening points are considered in the design of the redundant structural system. The value N_{sd} may be increased if the failure of one (= most unfavourable) fixing point is taken into account in the design (serviceability and ultimate limit state) of the structural system e.g. suspended ceiling.

Base material thickness, anchor spacing and edge distance

Anchor version			HUS-HR 6	HUS-A, -H, -I, -P 6
Nominal embedment depth	h_{nom}	[mm]	30	35
Effective anchorage depth	h_{ef}	[mm]	23	27
Minimum base material thickness	h_{min}	[mm]	80	80
Minimum spacing	s_{min}	[mm]	35	35
Minimum edge distance	c_{min}	[mm]	35	35 (80) ¹⁾
Critical spacing	s_{cr}	[mm]		3 h_{ef}
Critical edge distance	c_{cr}	[mm]		1,5 h_{ef}

¹⁾ see basic loading data

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced (see system design resistance).

Simplified design method for multiple use for non-structural applications (= redundant fastening)

Simplified version of the design method according ETAG 001, Annex C. Design resistance according data given in ETA-10/0005 issue 2013-06-26.

- Influence of concrete strength
- Influence of edge distance
- Influence of spacing
- Valid for a group of two anchors. (The method may also be applied for anchor groups with more than two anchors or more than one edge. The influencing factors must then be considered for each edge distance and spacing. The calculated design loads are then on the save side: They will be lower than the exact values according ETAG 001, Annex C.)

The design method is based on the following simplification:

- No different loads are acting on individual anchors (no eccentricity)

The values are valid for one anchor.

Design load – all load directions

Design resistance

$$F_{Rd} = F_{Rd}^0 \cdot f_B \cdot f_1 \cdot f_2 \cdot f_3 \cdot f_{re}$$

Basic design resistance

			Hilti tech. data	Data according ETA-10/0005, issue 2013-06-26	
Anchor version			HUS-HR 6		HUS-A, -H, -I, -P 6
Nominal embedment depth		h_{nom} [mm]	30		35
Basic design resistance in all load directions		$35 \leq c < 80 \text{ mm}$ F_{Rd}^0 [kN]	1,0		1,4
$c \geq 80 \text{ mm}$		F_{Rd}^0 [kN]	1,0	2,4	2,0

Influencing factors

Influence of concrete strength

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25\text{ N/mm}^2)^{0,5}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of edge distance a)

c/c_{cr}	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$f_1 = 0,7 + 0,3 \cdot c/c_{cr} \leq 1$	0,73	0,76	0,79	0,82	0,85	0,88	0,91	0,94	0,97	1
$f_2 = 0,5 \cdot (1 + c/c_{cr}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1

a) The edge distance shall not be smaller than the minimum edge distance c_{min} given in the table with the setting details. The influencing factors must be considered for every edge distance.

Influence of anchor spacing a)

s/s_{cr}	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$f_3 = 0,5 \cdot (1 + s/s_{cr}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1

a) The anchor spacing shall not be smaller than the minimum anchor spacing s_{min} given in the table with the setting details. This influencing factor must be considered for every anchor spacing.

Influence of reinforcement

h_{nom} [mm]	Dense reinforcement		Standard reinforcement a)	
	30	35	30	35
$f_{re} = 0,5 + h_{ef}/200\text{mm} \leq 1$	0,62	0,63	1	

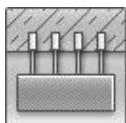

a) If in the area of anchorage there is reinforcement with a spacing $\geq 150 \text{ mm}$ (any diameter) or with a diameter $\leq 10 \text{ mm}$ and a spacing $\geq 100 \text{ mm}$, then a factor $f_{re,N} = 1$ may be applied.

HUS 6	HUS-S 6	Carbon steel Concrete Screw	<ul style="list-style-type: none"> - Quick and easy setting - Low expansion forces in base materials - Through fastening - Removable

Approvals / certificates

Description	Authority / Laboratory	No. / date of issue
Fire test report	IBMB, Braunschweig DIBt, Berlin	UB 3574/5146 / 2006-05-20
Assessment report (fire)	warringtonfire	WF 327804/A / 2013-07-10

Basic loading data

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Concrete as specified in the table
- ~~Steel~~/failure
- Concrete C 20/25, $f_{ck,cube} = 25 \text{ N/mm}^2$

Note:

When tightening the screw anchor in soft base materials and in hollow brick, care must be taken not to apply too much torque. If the screw anchor is over-tightened the fastening point is unusable for the HUS 6.

- Solid masonry units:
 - Mz 12 → solid brick, compressive strength 12N/mm², bulk density 1,8N/mm², format $\geq 240/175/113 \text{ mm}$ (length/width/height)
 - KS 12 → solid lime block, compressive strength 12N/mm², bulk density 2,0N/mm², format $\geq 240/175/113 \text{ mm}$ (length/width/height)
The core/material ratio in bricks and solid sand lime blocks may not exceed 15% of a bed joint area.
- Autoclaved aerated concrete:
 - PB6 → block, compressive strength 6 N/mm², bulk density 0,6 N/mm²
 - PB2 → block, compressive strength 2 N/mm², bulk density 0,2 N/mm²

- Other Limits:

- Applied loads to individual bricks/blocks without compression may not exceed 1,0 kN
- Applied loads to individual bricks/blocks with compression may not exceed 1,4 kN
- Data applies only to bricks/blocks, there is no test data available for loads in mortar joints. Hilti recommends at least a 50% load reduction or on site testing, if the location of the anchor in relation to the joint (see drawing) can not be specified because of wall plaster or insulation.
- Plaster, gravelling, lining or levelling courses are regarded as non-bearing and may not be taken into account for calculation of embedment depth.
- All data is for redundant fastening for non structural applications.

Recommended loads

Minimum depth of drill hole	$h_1 \geq$ [mm]	50	54 ^{b)}	64 ^{a)}	- ^{b)}
Diameter of clearance hole in the fixture to clamp a fixture	$d_f \leq$ [mm]			8,5	
Diameter of clearance hole in the fixture for stand-off applications	$d_f \leq$ [mm]			6,2	
Max. fastening thickness	t_{fix} [mm]			$l_s - h_{\text{nom}}$	
Max. installation torque	T_{inst} [Nm]	10	4	2	2

a) Holes must be drilled using rotary action only (no hammering action)

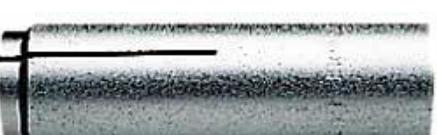

b) No anchor hole drilling required in PB2/PB4 gas aerated concrete

Permissible anchor location in brick and block walls

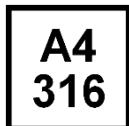

- Distance to free edge free edge to solid masonry (Mz and KS) units ≥ 200 mm
- Distance to free edge free edge to solid masonry (HLz and autoclaved aerated gas concrete) units ≥ 170 mm
- The minimum distance to horizontal and vertical mortar joint (c_{min}) is stated in the recommended load table.
- Data applies only to bricks/blocks, there is no test data available for loads in mortar joints. Hilti recommends at least a 50% load reduction or on site testing, if the location of the anchor in relation to the joint (see drawing) can not be specified because of wall plaster or insulation.
- Minimum anchor spacing (s_{min}) in one brick/block is $\geq 2 * c_{\text{min}}$

HKD Push-in anchor, Single anchor application

Anchor version	Benefits

Description	Authority / Laboratory	No. / date of issue
European technical approval ^{a)}	DIBt, Berlin	ETA-02/0032 / 2012-10-18

a) Anchors with anchorage depth $h_{ef} = 25\text{mm}$ are not covered by ETA

Basic loading data (for a single anchor)

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Concrete as specified in the table
- Steel failure
- Minimum base material thickness
- Concrete C 20/25, $f_{ck,cube} = 25 \text{ N/mm}^2$
- screw or rod with steel strength 5.8 (carbon steel) and/or A4-70 (stainless steel)

For details see Simplified design method

						560 280 560 280

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced.

Simplified design method

Simplified version of the design method according ETAG 001, Annex C. Design resistance according data given in ETA-02/0032, issue 2012-10-18.

- Influence of concrete strength
- Influence of edge distance
- Influence of spacing
- Valid for a group of two anchors. (The method may also be applied for anchor groups with more than two anchors or more than one edge. The influencing factors must then be considered for each edge distance and spacing. The calculated design loads are then on the safe side: They will be lower than the exact values according ETAG 001, Annex C. To avoid this, it is recommended to use the anchor design software PROFIS anchor)

The design method is based on the following simplification:

- No different loads are acting on individual anchors (no eccentricity)

The values are valid for one anchor.

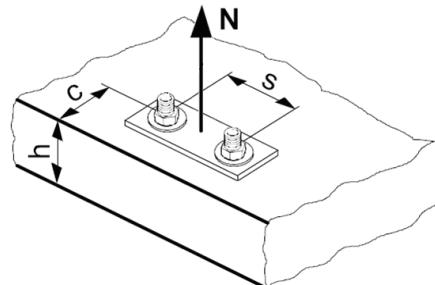

For more complex fastening applications please use the anchor design software PROFIS Anchor.

Tension loading

The design tensile resistance is the lower value of

- Steel resistance: $N_{Rd,s}$
- Concrete pull-out resistance: $N_{Rd,p} = N^0_{Rd,p} \cdot f_B$
- Concrete cone resistance: $N_{Rd,c} = N^0_{Rd,c} \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{re,N}$
- Concrete splitting resistance (only non-cracked concrete):

$$N_{Rd,sp} = N^0_{Rd,c} \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,sp} \cdot f_{re,N}$$

Basic design tensile resistance

Design steel resistance $N_{Rd,s}$ for HKD / HKD-E/S Steel Strength 5.8 and for HKD-ER/SR A4-70

	HKD-SR, HKD-ER [kN]	3,0	-	-	-	4,6	4,6	-	-	7,1	9,9	17,6	24,0

a) Splitting resistance must only be considered for non-cracked concrete

Influencing factors

Influence of concrete strength

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25\text{N/mm}^2)^{1/2}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of edge distance^{a)}

c/c _{cr,N}	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
c/c _{cr,sp}										
$f_{1,N} = 0,7 + 0,3 \cdot c/c_{cr,N} \leq 1$	0,73	0,76	0,79	0,82	0,85	0,88	0,91	0,94	0,97	1
$f_{1,sp} = 0,7 + 0,3 \cdot c/c_{cr,sp} \leq 1$										
$f_{2,N} = 0,5 \cdot (1 + c/c_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{2,sp} = 0,5 \cdot (1 + c/c_{cr,sp}) \leq 1$										

a) The edge distance shall not be smaller than the minimum edge distance c_{min} given in the table with the setting details. These influencing factors must be considered for every edge distance.

Influence of anchor spacing ^{a)}

$s/s_{cr,N}$	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$f_{3,N} = 0,5 \cdot (1 + s/s_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{3,sp} = 0,5 \cdot (1 + s/s_{cr,sp}) \leq 1$										

- a) The anchor spacing shall not be smaller than the minimum anchor spacing s_{min} given in the table with the setting details. This influencing factor must be considered for every anchor spacing.

Influence of base material thickness

h/h_{ef}	2,0	2,2	2,4	2,6	2,8	3,0	3,2	3,4	3,6	$\geq 3,68$
$f_{h,sp} = [h/(2 \cdot h_{ef})]^{2/3}$	1	1,07	1,13	1,19	1,25	1,31	1,37	1,42	1,48	1,5

Influence of reinforcement

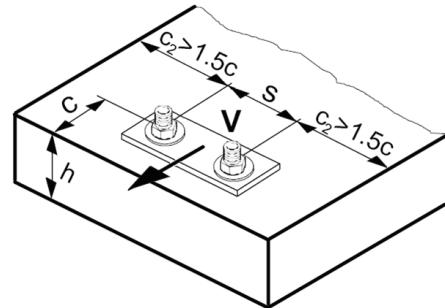

Anchor size	M6x25	M8x25	M10x25	M12x25	M6x30	M8x30	M8x40	M10x30	M10x40	M12x50	M16x65	M20x80
$f_{re,N} = 0,5 + h_{ef}/200\text{mm} \leq 1$	0,63 ^{a)}	0,63 ^{a)}	0,63 ^{a)}	0,63 ^{a)}	0,65 ^{a)}	0,65 ^{a)}	0,7 ^{a)}	0,65 ^{a)}	0,7 ^{a)}	0,75 ^{a)}	0,83 ^{a)}	0,9 ^{a)}

- a) This factor applies only for dense reinforcement. If in the area of anchorage there is reinforcement with a spacing ≥ 150 mm (any diameter) or with a diameter ≤ 10 mm and a spacing ≥ 100 mm, then a factor $f_{re,N} = 1$ may be applied.

Shear loading

The design shear resistance is the lower value of

- Steel resistance: $V_{Rd,s}$
- Concrete prout resistance: $V_{Rd,cp} = k \cdot N_{Rd,c}$
- Concrete edge resistance: $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_B \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Basic design shear resistance

Design steel resistance $V_{Rd,s}$ for HKD / HKD-E/S Steel Strength 5.8 and for HKD-ER/SR A4-70

		Hilti technical data				according ETA-02/0032, issue 2012-10-18

Influence of edge distance ^{a)}

c/d	4	6	8	10	15	20	30	40
$f_c = (d / c)^{0,19}$	0,77	0,71	0,67	0,65	0,60	0,57	0,52	0,50

a) The edge distance shall not be smaller than the minimum edge distance c_{min} .

Combined tension and shear loading

For combined tension and shear loading see section "Anchor Design".

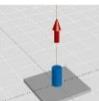

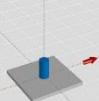

Precalculated values

Design resistance calculated according ETAG 001, Annex C and data given in ETA-02/0032, issue 2012-10-18.
All data applies to concrete C 20/25 – $f_{ck,cube} = 25 \text{ N/mm}^2$ and steel strength 5.8 and/or A4-70.

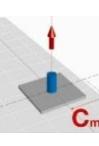

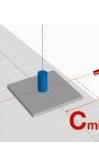

Recommended loads can be calculated by dividing the design resistance by an overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

a) All data given in this section for HKD-S(R) and HKD-E(R), according ETA-06/0047, issue 2012-09-28 . The anchor is to be used only for redundant fastening for non-structural applications.

Basic loading data for all load directions according design method B of ETAG 001

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Concrete C 20/25 $f_{ck,cube} = 25 \text{ N/mm}^2$ to C50/60, $f_{ck,cube} = 60 \text{ N/mm}^2$
- Minimum base material thickness
- Anchors in redundant fastening

a) With overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Requirements for redundant fastening

The definition of redundant fastening according to Member States is given in the ETAG 001 Part six, Annex 1. In Absence of a definition by a Member State the following default values may be taken

Minimum number of fixing points	Minimum number of anchors per fixing point	Maximum design load of action N_{sd} per fixing point ^{a)}
3	1	2 kN
4	1	3 kN

a) The value for maximum design load of actions per fastening point N_{sd} is valid in general that means all fastening points are considered in the design of the redundant structural system. The value N_{sd} may be increased if the failure of one (= most unfavourable) fixing point is taken into account in the design (serviceability and ultimate limit state) of the structural system e.g. suspended ceiling.

Depth of drill hole $h_1 \geq$ [mm]	27	32	27	33	43	27	33	43	27	54	70
Screwing depth l_s, min [mm]	6	6	8	8	8	10	10	10	12	12	16
	12	12,5	11,5	14,5	17,5	12	13	18	12	22	30,5
Diameter of clearance hole in the fixture $d_f \leq$ [mm]	7	7	9	9	9	12	12	12	14	14	18
Effective anchorage depth h_{ef} [mm]	25	30	25	30	40	25	30	40	25	50	65
Max. torque moment T_{inst} [Nm]	4	4	8	8	8	15	15	15	35	35	60

base material thickness, anchor spacing and edge distances

Anchor size	M6x25 M8x25 M10x25 M12x25	M6x30 M8x30 M10x30	M8x40 M10x40	M12x50	M16x65
Minimum base material thickness	h_{min} [mm]	80	80	80	-
Minimum spacing and Minimum edge distance HKD HKD-S (R) HKD-E (R)	s_{min} [mm] c_{min} [mm]	200 150	200 150	200 150	-
Minimum base material thickness	h_{min} [mm]	100	100	100	130
Minimum spacing and minimum edge distance HKD-S (R) HKD-E (R)	s_{min} [mm] c_{min} [mm]	80 140	60 105	80 140	125 175
Minimum spacing HKD	s_{min} [mm] for $c \geq$ [mm]	80 140	60 105	80 140	125 175
Minimum edge distance HKD	c_{min} [mm] for $s \geq$ [mm]	100 150	80 120	140 80	175 125
					

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced.

HKV Push-in anchor, Single anchor application

Anchor version	Benefits
 <p>HKV Carbon steel without lip</p>	<ul style="list-style-type: none"> - simple and well proven - approved, tested and confirmed by everyday jobsite experience - reliable setting thanks to simple visual check - versatile - for medium-duty fastening with bolts or threaded rods - available in various materials and sizes for maximized coverage of possible applications

Concrete

Basic loading data (for a single anchor)

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Concrete as specified in the table
- Minimum base material thickness
- Concrete C 20/25, $f_{ck,cube} = 25 \text{ N/mm}^2$
- screw or rod with steel strength 5.8 (carbon steel) and/or A4-70 (stainless steel)

Mean Ultimate Resistance

Anchor size	M6x25	M8x30	M10x30	M10x40	M12x50	M16x65

Service temperature range

Hilti HUD-1 universal anchor may be applied in the temperature range given below.

Temperature range	Base material temperature	Maximum long term base material temperature	Maximum short term base material temperature
Temperature range	-40 °C to +80 °C	+50 °C	+80 °C

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

d) With overall global safety factor $\gamma = 5$ to the characteristic loads and a partial safety factor of $\gamma = 1,4$ to the design values.

Service temperature range

Hilti HUD-L universal anchor may be applied in the temperature range given below.

Temperature range	Base material temperature	Maximum long term base material temperature	Maximum short term base material temperature
Temperature range	-40 °C to +80 °C	+50 °C	+80 °C

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

Materials

Material quality

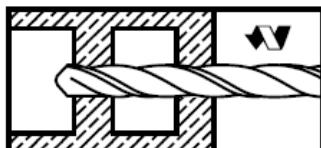

Part	Material
Plastic sleeve	Polyamide 6

Setting

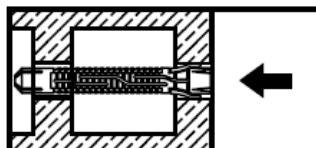

Installation equipment

Anchor size	HUD-L 6x50	HUD-L 8x60	HUD-L 10x70
Rotary hammer	TE 2 – TE 16		
Other tools	Screwdriver		

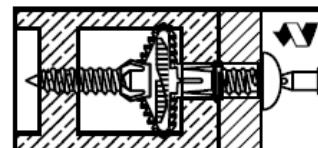

Setting instruction

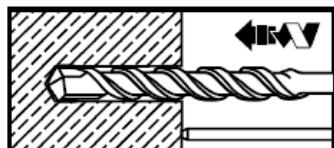

Drill hole with drill bit.

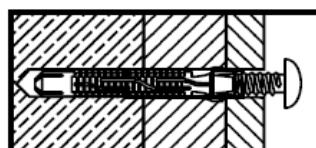

Install anchor.

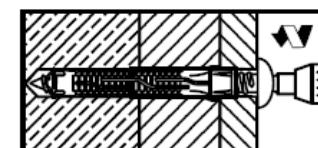

Put part being fastened in place and drive screw into anchor.

Drill hole with drill bit.

Put part being fastened in place and install anchor.

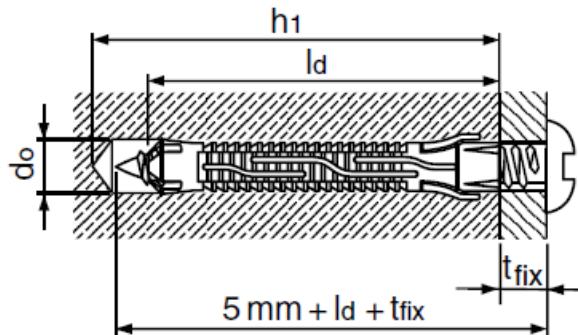

Drive screw into anchor.

Use only for wall and floor applications. Not applicable for ceiling and façade applications.

For detailed information on installation see instruction for use given with the package of the product.

Setting details: depth of drill hole h_1 and effective anchorage depth h_{ef}

Setting details HUD-L

Anchor version HUD-L	HUD-L 6x50	HUD-L 8x60	HUD-L 10x70
Nominal diameter of drill bit d_o [mm]	6	8	10
Cutting diameter of drill bit $d_{\text{cut}} \leq$ [mm]	6,4	8,45	10,45
Depth of drill hole $h_1 \geq$ [mm]	70	80	90
Effective anchorage depth h_{nom} [mm]	47	57	70
Anchor length l [mm]	47	57	70
Max fixture thickness t_{fix} [mm]	Depending on screw length		
Installation temperature [°C]	-10 to +40		
Recommended length of screw in base material l_d [mm]	55	65	75
Woodscrew diameter ^{a)} d [mm]	4,5 - 5	5 - 6	7 - 8

a) The basic loading data are depending on the woodscrew diameters, if other types or different screws are used the load capacity may decrease. Highlighted diameters refer to basic loading data table.

HLD Light duty anchor

Anchor version	Benefits
 HLD	<ul style="list-style-type: none"> - plastic undercut anchor - simple setting - esp. for drywall applications

Drywall

Basic loading data (for a single anchor)

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Base material as specified in the table
- Load data given in the tables is independent of load direction

Characteristic resistance

Anchor size		HLD 2	HLD 3	HLD 4

Requirements for redundant fastening

The definition of redundant fastening according to Member States is given in the ETAG 020. In Absence of a definition by a Member State the following default values may be taken

Minimum number of fixing points	Minimum number of anchors per fixing point	Maximum design load of action N_{sd} per fixing point ^{a)}
3	1	3 kN
4	1	4,5 kN

- a) The value for maximum design load of actions per fastening point N_{sd} is valid in general that means all fastening points are considered in the design of the redundant structural system.

Service temperature range

Hilti HRD frame anchors may be applied in the temperature range given below.

Temperature range	Base material temperature	Maximum long term base material temperature	Maximum short term base material temperature
Temperature range	-40 °C to +80 °C	+50 °C	+80 °C

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

	Concrete C12/15	s_{min} [mm] for $c \geq$ [mm]	140 70	70 140 ^{c)}	
	Masonry and AAC	a_{min} [mm]	250	250	
	Masonry and AAC	$s_{\text{min}1}$ [mm] $s_{\text{min}2}$ [mm]	200 (120 ^{d)} 400 (240 ^{d)}	100 100	
	Concrete $\geq \text{C16/20}$	c_{min} [mm] for $s \geq$ [mm]	50 100	50 150 ^{c)}	
Minimum edge distance	Concrete C12/15	c_{min} [mm] for $s \geq$ [mm]	70 140	70 210 ^{c)}	
	Masonry and AAC	c_{min} [mm]	100 (60 ^{d)}	100	
	Critical spacing in concrete ^{a)}	$s_{\text{cr},N}$ [mm]	62	80	125
Critical edge distance in concrete ^{b)}	Concrete C12/15	$s_{\text{cr},N}$ [mm]	68	90	135
	Concrete $\geq \text{C16/20}$	$c_{\text{cr},N}$ [mm]	100	100	
	Concrete C12/15	$c_{\text{cr},N}$ [mm]	140	140	

^{a)} For spacing larger than the critical spacing each anchor in a group can be considered in design.

^{b)} For edge distance smaller than critical edge distance the design loads have to be reduced.

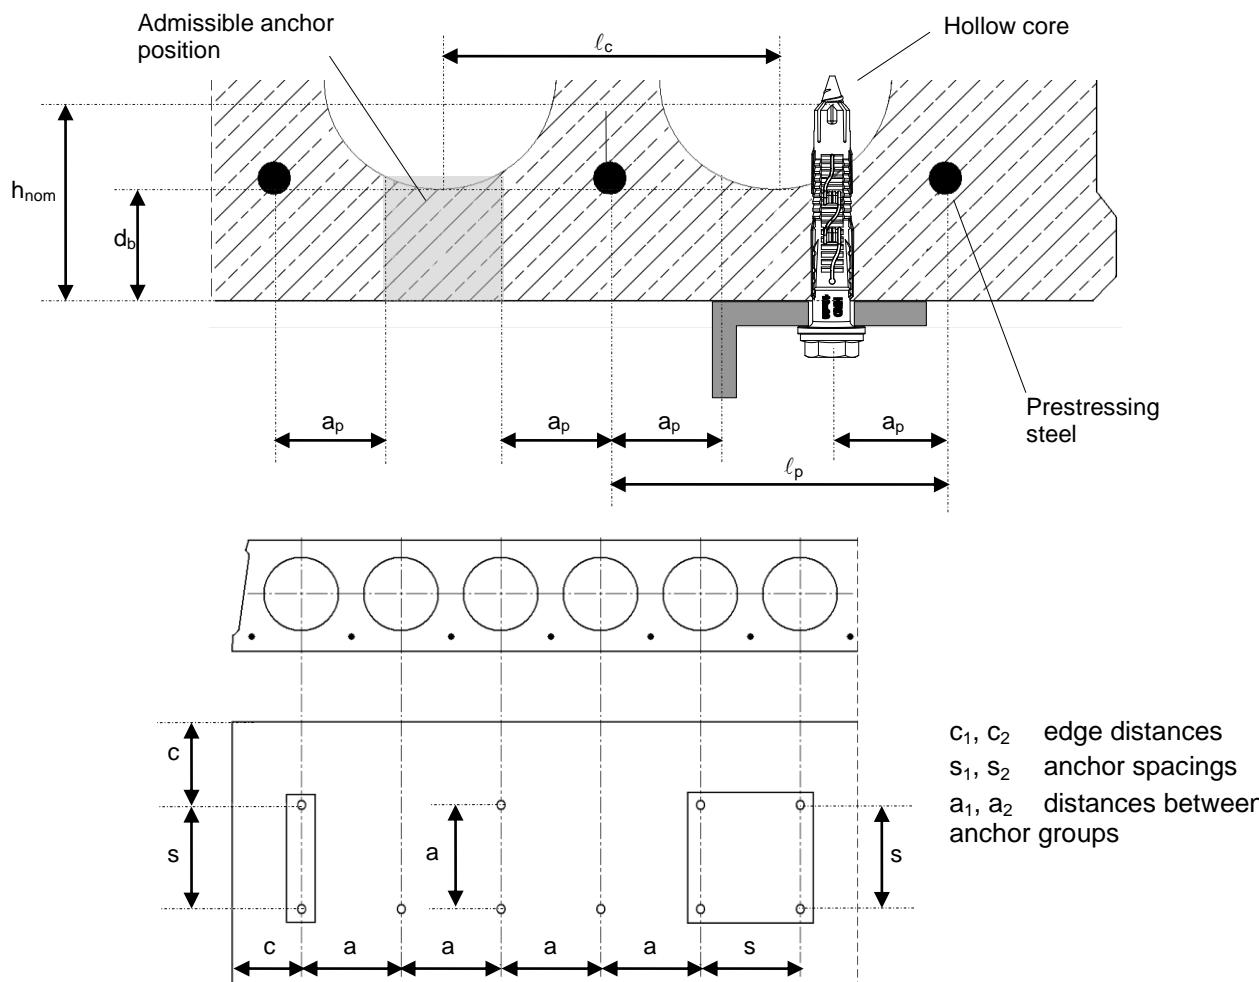

^{c)} Linear interpolation allowed

^{d)} only for brick "Doppio Uni" and "Mattone"

Admissible anchor positions, minimum spacing and edge distance of anchors and distance between anchor groups in precast prestressed hollow core slabs

Anchor type		HRD 8	HRD 10
Overall plastic anchor embedment depth in the base material	$h_{\text{nom}} \geq [\text{mm}]$	-	50
Bottom flange thickness	$d_b \geq [\text{mm}]$	-	25
Core distance	$\ell_c \geq [\text{mm}]$	-	100
Prestressing steel distance	$\ell_p \geq [\text{mm}]$	-	100
Distance between anchor position and prestressing steel	$a_p \geq [\text{mm}]$	-	50
Minimum edge distance	$c_{\min} \geq [\text{mm}]$	-	100
Minimum anchor spacing	$s_{\min} \geq [\text{mm}]$	-	100
Minimum distance between anchor groups	$a_{\min} \geq [\text{mm}]$	-	100

Schemes of distances and spacing

Design method

Design method according ETAG 020, Annex C. Design resistance according data given in ETA-07/0219, issue 2012-09-18.

- Valid for a group of two anchors
- Influence of edge distance

The design method is based on the following simplifications:

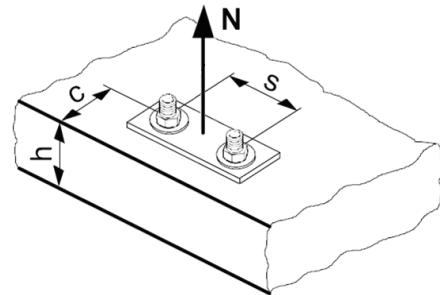

- Minimum base material thickness h_{\min}
- All data for concrete C16/20 – C50/60
- No different loads are acting on individual anchors (no eccentricity)
- Shear without lever arm

The values are valid for a single anchor or a anchor group with spacing $< s_{cr,N}$ (for anchor groups with spacing $\geq s_{cr,N}$ each anchor can be considered as acting like a single anchor).

Tension loading in concrete

The design tensile resistance is the lower value of

- Steel resistance: $N_{Rd,s}$
- Concrete pull-out resistance: $N_{Rd,p}$
- Concrete cone resistance: $N_{Rd,c} = N_{Rd,p} \cdot (c/c_{cr,N})$

Basic design tensile resistance

Design steel resistance $N_{Rd,s}$

Anchor size	HRD 8	HRD 10	
	$h_{\text{nom}} = 50\text{mm}$	$h_{\text{nom}} = 50\text{mm}$	$h_{\text{nom}} \geq 70\text{mm}$
$N_{Rd,s}$	Carbon steel [kN]	7,3	11,7
	Stainless steel [kN]	6,8	11,6

Design pull-out resistance $N_{Rd,p}$

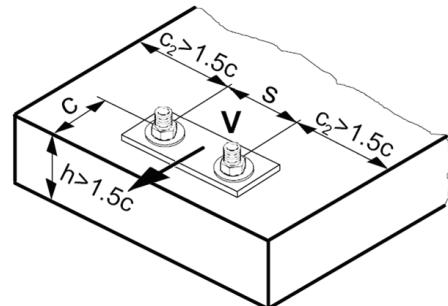

Design concrete cone resistance $N_{Rd,c} = N_{Rd,p} \cdot (c/c_{cr,N})$

Anchor size	HRD 8	HRD 10	
	$h_{\text{nom}} = 50\text{mm}$	$h_{\text{nom}} = 50\text{mm}$	$h_{\text{nom}} \geq 70\text{mm}$
$N_{Rd,p}$	Carbon steel [kN]	1,7	2,5
	Stainless steel [kN]	1,7	2,5

Shear loading in concrete

The design shear resistance is the lower value of

- Steel resistance: $V_{Rd,s}$
- Concrete edge resistance: $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_c$

Basic design shear resistance

Design steel resistance $V_{Rd,s}$

Anchor size	HRD 8	HRD 10	$h_{nom} = 50\text{mm}$	$h_{nom} = 50\text{mm}$	$h_{nom} \geq 70\text{mm}$
$V_{Rd,s}$	Carbon steel [kN]	5,5	8,5	8,5	
	Stainless steel [kN]	5,2	8,5	8,5	

Design concrete edge resistance^{a)} $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_c$

Anchor type	HRD 8	HRD 10	$h_{nom} = 50\text{mm}$	$h_{nom} = 50\text{mm}$	$h_{nom} \geq 70\text{mm}$
$V_{Rd,c}^0$ [kN]	5,1	5,5	5,1	5,5	5,8

a) For anchor groups only the anchors close to the edge must be considered

Influencing factors

Influence of concrete strength

Concrete strength designation (ENV 206)	C 16/20	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25\text{N/mm}^2)^{1/2}$ a)	0,89	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of edge distance for different base material thickness^{a)}

c [mm]	50	60	70	80	90	100	120	140	160	180	200	220
$h = 100\text{ mm}$	0,35	0,46	0,57	0,65	0,73	0,82	0,98	1,14	1,31	1,47	1,63	1,80
$h = 120\text{ mm}$	0,35	0,46	0,59	0,72	0,80	0,89	1,07	1,25	1,43	1,61	1,79	1,97
$h = 150\text{ mm}$	0,35	0,46	0,59	0,72	0,85	1,00	1,20	1,40	1,60	1,80	2,00	2,20
$h = 180\text{ mm}$	0,35	0,46	0,59	0,72	0,85	1,00	1,31	1,53	1,75	1,97	2,19	2,41

a) The edge distance shall not be smaller than the minimum edge distance c_{min} .

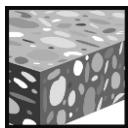

The base material thickness shall not be smaller than the minimum base material thickness h_{min} .

Combined TENSION and SHEAR loading in masonry

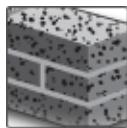

The design resistance in masonry and AAC F_{Rd} (see basic loading data) shall be used in each load direction for single anchors and anchor groups.

HRV Frame anchor

Anchor version	Benefits
 HRV-H 10x80 HRV-H 10x100 HRV-HF 10x80 HRV-HF 10x100	<ul style="list-style-type: none"> • Available in CS and HDG • Suitable for concrete and solid brick • Integrated plastic and steel washers

Concrete

Solid brick

Basic loading data according Hilti technical data assessment

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Non-cracked concrete C16/20 – C50/60, other base material as specified
- Minimum base material thickness
- Steel/failure
- Shear without lever arm
- Anchors for single point application

Mean ultimate resistance

^{a)} With overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Service temperature range

Hilti HRV frame anchors may be applied in the temperature range given below.

Temperature range	Base material temperature	Maximum long term base material temperature	Maximum short term base material temperature
Temperature range	-40 °C to +80 °C	+50 °C	+80 °C

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

Basic loading data for temporary application

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Base material as specified in the table

Basic loading data for temporary application in standard and fresh concrete < 28 days old, $f_{ck,cube} \geq 10 \text{ N/mm}^2$:

All data in this section applies to the following conditions:

- Strength class, $f_{ck,cube} \geq 10 \text{ N/mm}^2$
- Only temporary use
- Screw is reusable, before each usage it must be checked according Hilti instruction for use with the suited tube Hilti HRG
- Design resistance are valid for single anchor only
- Design resistance are valid for all load direction and valid for both cracked and non-cracked concrete
- Minimum base material thickness
- No edge distance and spacing influence

Design resistance for all directions in cracked in non-cracked concrete

Anchor			HCA 5/8" x 90	HCA 5/8" x 130

Anchor size	DBZ 6/4,5	DBZ 6/35
Resistance F_{Rk} [kN]	4,0	4,0

Design resistance, all load directions

Anchor size	DBZ 6/4,5	DBZ 6/35
Resistance F_{Rd} [kN]	2,2	2,2
Anchor size	DBZ 6/4,5	DBZ 6/35

Recommended loads ^{a)}, all load directions

Anchor size	DBZ 6/4,5	DBZ 6/35
Resistance F_{Rec} [kN]	1,6	1,6
Anchor size	DBZ 6/4,5	DBZ 6/35

- a) With overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Requirements for redundant fastening

The definition of redundant fastening according to Member States is given in the ETAG 001 Part six, Annex 1. In Absence of a definition by a Member State the following default values may be taken

Minimum number of fixing points	Minimum number of anchors per fixing point	Maximum design load of action N_{Sd} per fixing point ^{a)}
3	1	2 kN
4	1	3 kN

- a) The value for maximum design load of actions per fastening point N_{Sd} is valid in general that means all fastening points are considered in the design of the redundant structural system. The value N_{Sd} may be increased if the failure of one (= most unfavourable) fixing point is taken into account in the design (serviceability and ultimate limit state) of the structural system e.g. suspended ceiling.

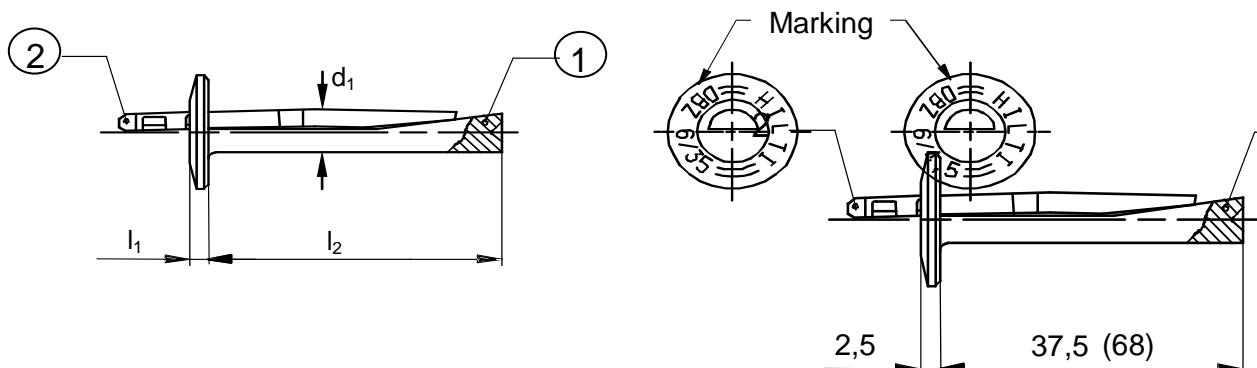

Materials

Mechanical properties of DBZ

Anchor size	DBZ 6/4,5	DBZ 6/35
Nominal tensile strength f_{uk} [N/mm ²]	390	390
Yield strength f_{yk} [N/mm ²]	310	310
Stressed cross-section A_s [mm ²]	26	26
Char. bending resistance $M_{Rk,s}^0$ [Nm]	5,0	5,0

Material quality of DBZ

a) for all load directions (tension, shear and combined tension and shear loads)

Recommended loads^{a)}, all load directions

Anchor size (carbon steel)	HK6	HK6L	HK8
Resistance F_{rec} ^{b)} [kN]	0,8	1,4	1,4
Anchor size (stainless steel, HCR)	HK6 -R /-HCR	HK6L -R /-HCR	HK8 -R /-HCR
Resistance F_{rec} ^{b)} [kN]	0,4	0,8	1,6

a) With overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

b) for all load directions (tension, shear and combined tension and shear loads)

Special case: Groups of n=2 and/or n=4 anchors with small spacing

The basic loading data for a single anchor is valid for one fixing point.

Fixing points can be:

- **single anchors**,
- or
- **groups of 2 anchors**
with $s_1 \geq 60$ mm
- or
- **groups of 4 anchors**
with $s_1 \geq 100$ mm and $s_2 \geq 100$ mm

Requirements for multiple use

The definition of multiple use according to Member States is given in the ETAG 001 Part six, Annex 1. In Absence of a definition by a Member State the following default values may be taken

Minimum number of fixing points	Minimum number of anchors per fixing point	Maximum design load of action N_{sd} per fixing point ^{a)}
3	1	2 kN
4	1	3 kN

a) The value for maximum design load of actions per fastening point N_{sd} is valid in general that means all fastening points are considered in the design of the redundant structural system. The value N_{sd} may be increased if the failure of one (= most unfavourable) fixing point is taken into account in the design (serviceability and ultimate limit state) of the structural system e.g. suspended ceiling.

Sprinkler	VdS, Cologne	G 4981083 / 2008-01-01

a) All data given in this section according Z-21.1-1729, issue 2011-05-31.

Basic loading data (for a single anchor)

All data in this section applies to

- Correct setting (See setting instruction)
 - No edge distance and spacing influence
 - Autoclaved aerated concrete (AAC)
 - Load data given in the tables is independent of load direction
- Minimum base material thickness

Recommended loads

Anchor size	Non-cracked AAC ^{a)}			Cracked AAC		
	M6	M8	M10	M6	M8	M10
Recommended load for a single anchor						
AAC blocks,	AAC 2 [kN]	0,4	0,4	0,6	-	-
	AAC 4, AAC 6 [kN]	0,8	0,8	1,2	-	-
AAC wall members	P 3,3 [kN]	0,6	0,6	0,8	-	-
	P 4,4 [kN]	0,8	0,8	1,2	-	-

HIF Insulation fastener

Anchor version	Benefits
 HIF	<ul style="list-style-type: none"> - Especially for soft insulation material 90mm is ideal not to sink in the surface, no additional plate has to be used - Drilling, hammering, done - Speed due to less drilling effort - With anchors up to 240mm insulation thickness the whole application is covered

Basic loading data (for a single anchor)

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Base material as specified in the table
- Minimum base material thickness
- Tensile loads only

Recommended loads ^{a)}

	HIF	
Concrete ≥ C16/20	N _{rec}	[kN] 0,03
Solid clay brick Mz 20 – 1,8 – NF	N _{rec}	[kN] 0,03
Solid sand-lime brick KS 12 – 1,6 – 2DF	N _{rec}	[kN] 0,03
Hollow clay brick ^{c)} Hz 12 – 0,8 – 6DF	N _{rec}	[kN] 0,025 ^{b)}
Hollow sand-lime brick ^{c)} KSL 12	N _{rec}	[kN] 0,03
Autoclaved aerated concrete AAC 4	N _{rec}	[kN] 0,02

a) Recommended loads N_{rec} are based on a global safety factor $\gamma = 5$ to the characteristic resistance. Design resistance N_{Rd} can be derived by multiplying N_{rec} with a partial safety factor of $\gamma_F = 1,4$.

b) Drilling without hammering

c) Thickness of web for Hz ≥ 18mm, for KSL ≥ 25mm

Service temperature range

Hilti HIF insulation fastener may be applied in the temperature range given below.

Temperature range	Base material temperature	Maximum long term base material temperature	Maximum short term base material temperature
Temperature range	-40 °C to +40 °C	+24 °C	+40 °C

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

Materials

Material quality

Part	Material
Plastic sleeve	Polypropylene

Thermal parameters

Point thermal transmittance χ	0,000 W/K ^{a)}
------------------------------------	-------------------------

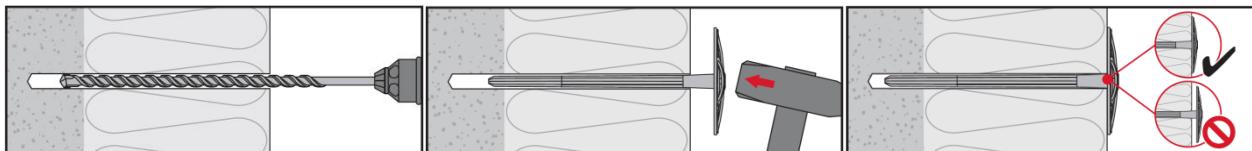

a) According EOTA Technical Report TR 025, the value 0,000 W/K may be taken, if the peak value of the point thermal transmittance χ in the considered range is smaller than 0,0005 W/K.

IDP Insulation fastener

Anchor version	Benefits
 <p>IDP</p>	<ul style="list-style-type: none"> - for insulating up to 15 cm - simple setting

Basic loading data (for a single anchor)

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Base material as specified in the table
- Minimum base material thickness
- Loads shall be reduced and number of fasteners shall be increased if the temperature sustains above 40°C

Recommended loads ^{a)}

		IDP
Concrete ≥ C16/20	N _{rec} [kN]	0,14
Solid clay brick Mz 20 – 1,8 – NF	N _{rec} [kN]	0,14
Solid sand-lime brick KS 12 – 1,6 – 2DF	N _{rec} [kN]	0,14
Hollow clay brick Hlz 12 – 0,8 – 6DF	N _{rec} [kN]	0,04 ^{b)}
Hollow sand-lime brick KSL 12 – 1,4 – 3DF	N _{rec} [kN]	0,04

a) With overall global safety factor $\gamma = 5$ to the characteristic loads and a partial safety factor of $\gamma = 1,4$ to the design values.

b) Drilling without hammering

Recommended number of IDP not regarding wind suction

			Number of fasteners per m ²
Expanded polystyrene (EPS)	density ≤ 40 kg/m ³	thickness ≤ 150 mm	4
Polyurethane (PU) Mineral wool	density ≤ 150 kg/m ³	thickness ≤ 100 mm	4
		thickness ≤ 150 mm	6

The data is only valid if no further material is applied on the insulation, e.g. plaster. Otherwise number of fasteners have to be increased.

Materials

a) With overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Service temperature range

Hilti HVZ adhesive anchor with anchor rod HAS-TZ may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

Temperature range	Base material temperature	Maximum long term base material temperature	Maximum short term base material temperature
Temperature range I	-40 °C to +80 °C	+50 °C	+80 °C

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

Materials

Setting instruction

Dry and water-saturated concrete, hammer drilling

For detailed information on installation see instruction for use given with the package of the product.

For technical data for anchors in diamond drilled holes please contact the Hilti Technical advisory service.

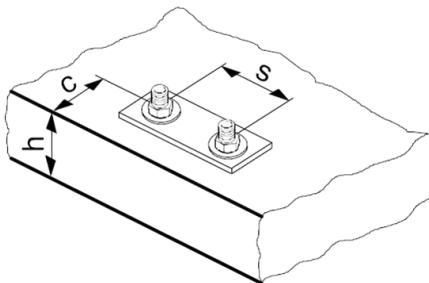

Curing time for general conditions

Data according ETA-03/0032, issue 2013-06-04	
Temperature of the base material	Curing time before anchor can be fully loaded t_{cure}
$\geq 20^{\circ}\text{C}$	20 min
10 °C to 20 °C	30 min
0 °C to 10 °C	60 min

These data are valid for dry concrete only. In wet concrete the curing time must be doubled.

Setting details

		Data according ETA-03/0032, issue 2013-06-04				
Anchor size		M10x75	M12x95	M16x105	M16x125	M20x170
Nominal diameter of drill bit	d ₀ [mm]	12	14	18	18	25
Diameter of element	d [mm]	10	12	16	16	20
Effective anchorage depth	h _{ef} [mm]	75	95	105	125	170
Drill hole depth	h ₁ [mm]	90	110	125	145	195
Minimum base material thickness	h _{min} ^{a)} [mm]	150	190	210	250	340
Diameter of clearance hole in the fixture	d _f [mm]	12	14	18	18	22
Cracked concrete						
Minimum spacing	s _{min} [mm]	50	60	70	70	80
Minimum edge distance	c _{min} [mm]	50	60	70	70	80
Non cracked concrete						
Minimum spacing	s _{min} [mm]	50	60	70	70	80
Minimum edge distance	c _{min} [mm]	50	70	85	85	80
Critical spacing for splitting failure	s _{cr,sp} [mm]	2 c _{cr,sp}				
Critical edge distance for splitting failure	c _{cr,sp} [mm]	1,5 h _{ef}				
Critical spacing for concrete cone failure	s _{cr,N}	2 c _{cr,N}				
Critical edge distance for concrete cone failure	c _{cr,N} ^{b)}	1,5 h _{ef}				
Torque moment ^{c)}	T _{max} [Nm]	40	50	90	90	150

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced.

- a) h: base material thickness ($h \geq h_{\min}$)
- b) The critical edge distance for concrete cone failure depends on the embedment depth h_{ef} and the design bond resistance. The simplified formula given in this table is on the save side.
- c) This is the maximum recommended torque moment to avoid splitting failure during installation for anchors with minimum spacing and/or edge distance.

Simplified design method

Simplified version of the design method according ETAG 001, Annex C. Design resistance according data given in ETA-03/0032, issue 2013-06-04.

- Influence of concrete strength
- Influence of edge distance
- Influence of spacing
- Valid for a group of two anchors. (The method may also be applied for anchor groups with more than two anchors or more than one edge distance. The influencing factors must then be considered for each edge distance and spacing. The calculated design loads are then on the save side: They will be lower than the exact values according ETAG 001, Annex C. To avoid this, it is recommended to use the anchor design software PROFIS anchor)

The design method is based on the following simplification:

- No different loads are acting on individual anchors (no eccentricity)

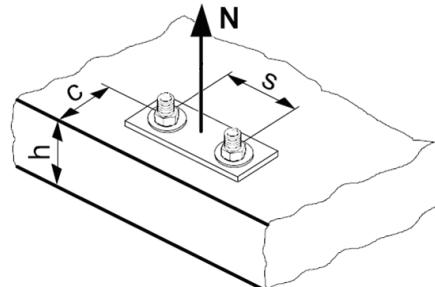

The values are valid for one anchor.

For more complex fastening applications please use the anchor design software PROFIS Anchor.

Tension loading

The design tensile resistance is the lower value of

- Steel resistance: $N_{Rd,s}$
- Combined pull-out and concrete cone resistance: $N_{Rd,p} = N^0_{Rd,p} \cdot f_{B,p} \cdot f_{h,p}$
- Concrete cone resistance: $N_{Rd,c} = N^0_{Rd,c} \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,N} \cdot f_{re,N}$
- Concrete splitting resistance (only non-cracked concrete): $N_{Rd,sp} = N^0_{Rd,sp} \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,sp} \cdot f_{re,N}$

Basic design tensile resistance

Design steel resistance $N_{Rd,s}$

		Data according ETA-03/0032, issue 2013-06-04				
Anchor size		M10x75	M12x95	M16x105	M16x125	M20x170
$N_{Rd,s}$	HAS-TZ					
	HAS-R-TZ	[kN]	23,3	34,0	60,0	60,0
	HAS-HCR-TZ					121,3

Design combined pull-out and concrete cone resistance $N_{Rd,p} = N^0_{Rd,p} \cdot f_{B,p} \cdot f_{h,p}$

		Data according ETA-03/0032, issue 2013-06-04				
Anchor size		M10x75	M12x95	M16x105	M16x125	M20x170
Embedment depth h_{ef} [mm]		75	95	105	125	170

$f_{3,sp} = 0,5 \cdot (1 + s/s_{cr,sp}) \leq 1$										

a) The anchor spacing shall not be smaller than the minimum anchor spacing s_{min} given in the table with the setting details. This influencing factor must be considered for every anchor spacing.

Influence of embedment depth on concrete cone resistance

$$f_{h,N} = (h_{ef}/h_{ef,typ})^{1,5}$$

Influence of reinforcement

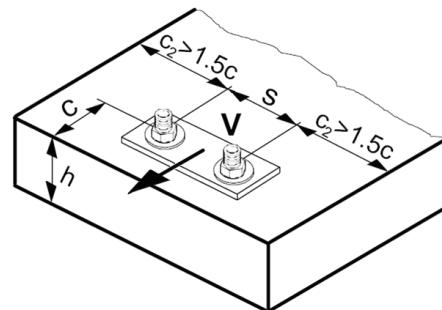

h_{ef} [mm]	40	50	60	70	80	90	≥ 100
$f_{re,N} = 0,5 + h_{ef}/200\text{mm} \leq 1$	0,7 a)	0,75 a)	0,8 a)	0,85 a)	0,9 a)	0,95 a)	1

a) This factor applies only for dense reinforcement. If in the area of anchorage there is reinforcement with a spacing ≥ 150 mm (any diameter) or with a diameter ≤ 10 mm and a spacing ≥ 100 mm, then a factor $f_{re} = 1$ may be applied.

Shear loading

The design shear resistance is the lower value of

- Steel resistance: $V_{Rd,s}$
- Concrete prout resistance: $V_{Rd,cp} = k \cdot \text{lower value of } N_{Rd,p} \text{ and } N_{Rd,c}$
- Concrete edge resistance: $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_\beta \cdot f_h \cdot f_4$

Basic design shear resistance

Design steel resistance $V_{Rd,s}$

		Data according ETA-03/0032, issue 2013-06-04				
Anchor size		M10x75	M12x95	M16x105	M16x125	M20x170
$V_{Rd,s}$	HAS-TZ	[kN]	14,4	21,6	40,8	40,8
$V_{Rd,s}$	HAS-R-TZ HAS-HCR-TZ	[kN]	16,0	24,0	44,8	78,4

Design concrete prout resistance $V_{Rd,cp} = \text{lower value}^a) \text{ of } k \cdot N_{Rd,p} \text{ and } k \cdot N_{Rd,c}$

$k = 1$ for $h_{ef} < 60$ mm

$k = 2$ for $h_{ef} \geq 60$ mm

- a) $N_{Rd,p}$: Design combined pull-out and concrete cone resistance
 $N_{Rd,c}$: Design concrete cone resistance

Design concrete edge resistance ^{a)} $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_\beta \cdot f_h \cdot f_4$

Anchor size	Non-cracked concrete					Cracked concrete					
	M10x75	M12x95	M16x105	M16x125	M20x170	M10x75	M12x95	M16x105	M16x125	M20x170	
$V_{Rd,c}^0$	[kN]	3,7	6,7	9,9	10,3	11,0	2,7	3,8	5,3	5,5	7,9

a) For anchor groups only the anchors close to the edge must be considered.

Influencing factors

Influence of concrete strength

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25\text{N/mm}^2)^{1/2} a)$	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of angle between load applied and the direction perpendicular to the free edge

Angle β	0°	10°	20°	30°	40°	50°	60°	70°	80°	$\geq 90^\circ$
$f_\beta = \sqrt{\frac{1}{(\cos \alpha_v)^2 + \left(\frac{\sin \alpha_v}{2,5}\right)^2}}$	1	1,01	1,05	1,13	1,24	1,40	1,64	1,97	2,32	2,50

Influence of base material thickness

h/c	0,15	0,3	0,45	0,6	0,75	0,9	1,05	1,2	1,35	$\geq 1,5$
$f_h = \{h/(1,5 \cdot c)\}^{2/3} \leq 1$	0,22	0,34	0,45	0,54	0,63	0,71	0,79	0,86	0,93	1,00

Influence of anchor spacing and edge distance ^{a)} for concrete edge resistance: f_4

$$f_4 = (c/h_{\text{ef}})^{1,5} \cdot (1 + s / [3 \cdot c]) \cdot 0,5$$

c/h _{ef}	Single anchor	Group of two anchors s/h _{ef}												
		0,75	1,50	2,25	3,00	3,75	4,50	5,25	6,00	6,75	7,50	8,25	9,00	9,75
0,50	0,35	0,27	0,35	0,35	0,35	0,35	0,35	0,35	0,35	0,35	0,35	0,35	0,35	0,35

a) The anchor spacing and the edge distance shall not be smaller than the minimum anchor spacing s_{\min} and the minimum edge distance c_{\min} .

Combined tension and shear loading

For combined tension and shear loading see section "Anchor Design".

Precalculated values

Recommended loads can be calculated by dividing the design resistance by an overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

a) All data given in this section according

ETA-05/0255, issue 2011-06-23

Basic loading data (for a single anchor)

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- **Steel failure**
- Base material thickness, as specified in the table
- **One typical embedment depth**, as specified in the table
- **One anchor material**, as specified in the tables
- Concrete C 20/25, $f_{ck,cube} = 25 \text{ N/mm}^2$
- Temperate range I
(min. base material temperature -40°C, max. long term/short term base material temperature: +24°C/40°C)
- Installation temperature range -5°C to +40°C

For details see Simplified design method

**Embedment depth^{a)} and base material thickness for the basic loading data.
Mean ultimate resistance, characteristic resistance, design resistance, recommended loads.**

Anchor size	M8	M10	M12	M16	M20	M24	M27	M30
Typical embedment depth [mm]	80	90	110	125	170	210	240	270
Base material thickness [mm]	140	160	210	210	340	370	480	540

a) The allowed range of embedment depth is shown in the setting details. The corresponding load values can be calculated according to the simplified design method.

a) With overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Service temperature range

Hilti HVU adhesive may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

Temperature range	Base material temperature	Maximum long term base material temperature	Maximum short term base material temperature
Temperature range I	-40 °C to +40 °C	+24 °C	+40 °C
Temperature range II	-40 °C to +80 °C	+50 °C	+80 °C
Temperature range III	-40 °C to +120 °C	+72 °C	+120 °C

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

For technical data for anchors in diamond drilled holes please contact the Hilti Technical advisory service.

Curing time for general conditions

Data according ETA-05/0255, issue 2011-06-23	
Temperature of the base material	Curing time before anchor can be fully loaded t_{cure}
20 °C to 40 °C	20 min
10 °C to 19 °C	30 min
0 °C to 9 °C	1 h
-5 °C to -1 °C	5 h

Setting details

		Data according ETA-05/0255, issue 2011-06-23									
Anchor size		M8	M10	M12	M16	M20	M24	M27	M30		
Nominal diameter of drill bit	d_0 [mm]	10	12	14	18	24	28	30	35		
Effective anchorage and drill hole depth	h_{ef} [mm]	80	90	110	125	170	210	240	270		
Minimum base material thickness	$h_{\text{min}}^{\text{a)}$ [mm]	110	120	140	170	220	270	300	340		
Diameter of clearance hole in the fixture	d_f [mm]	9	12	14	18	22	26	30	33		
Minimum spacing	s_{min} [mm]	40	45	55	65	90	120	130	135		
Minimum edge distance	c_{min} [mm]	40	45	55	65	90	120	130	135		
Critical spacing for splitting failure	$s_{\text{cr,sp}}$	2 $c_{\text{cr,sp}}$									
Critical edge distance for splitting failure ^{b)}	$c_{\text{cr,sp}}$ [mm]	$1,0 \cdot h_{\text{ef}}$ for $h / h_{\text{ef}} \geq 2,0$									
		$4,6 h_{\text{ef}} - 1,8 h$ for $2,0 > h / h_{\text{ef}} > 1,3$									
		$2,26 h_{\text{ef}}$ for $h / h_{\text{ef}} \leq 1,3$									
Critical spacing for concrete cone failure	$s_{\text{cr,N}}$	2 $c_{\text{cr,N}}$									
Critical edge distance for concrete cone failure ^{c)}	$c_{\text{cr,N}}$	1,5 h_{ef}									
Critical spacing for concrete cone failure	$s_{\text{cr,N}}$	2 $c_{\text{cr,N}}$									
Critical edge distance for concrete cone failure	$c_{\text{cr,N}}$	1,5 h_{ef}									
Torque moment ^{c)}	T_{max} [Nm]	10	20	40	80	150	200	270	300		

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced.

- a) h : base material thickness ($h \geq h_{\text{min}}$)
- b) h : base material thickness ($h \geq h_{\text{min}}$)
- c) This is the maximum recommended torque moment to avoid splitting failure during installation for anchors with minimum spacing and/or edge distance.

Simplified design method

Simplified version of the design method according EOTA Technical Report TR 029. Design resistance according data given in ETA-05/0255, issue 2011-06-23.

- Influence of concrete strength
- Influence of edge distance
- Influence of spacing
- Valid for a group of two anchors. (The method may also be applied for anchor groups with more than two anchors or more than one edge distance. The influencing factors must then be considered for each edge distance and spacing. The calculated design loads are then on the same side: They will be lower than the exact values according EOTA Technical Report TR 029. To avoid this, it is recommended to use the anchor design software PROFIS anchor)

The design method is based on the following simplification:

- No different loads are acting on individual anchors (no eccentricity)

The values are valid for one anchor.

For more complex fastening applications please use the anchor design software PROFIS Anchor.

Tension loading

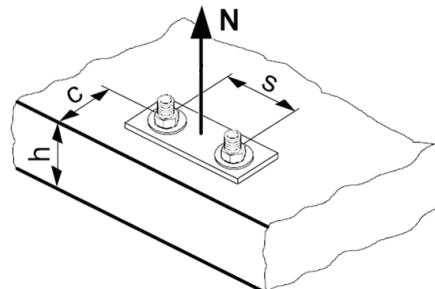

The design tensile resistance is the lower value of

- Steel resistance: $N_{Rd,s}$

- Combined pull-out and concrete cone resistance: $N_{Rd,p} = N_{Rd,c}^0 \cdot f_{B,p} \cdot f_{h,p}$

- Concrete cone resistance: $N_{Rd,c} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,N} \cdot f_{re,N}$

- Concrete splitting resistance (only non-cracked concrete): $N_{Rd,sp} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,sp} \cdot f_{re,N}$

Basic design tensile resistance

Design steel resistance $N_{Rd,s}$

		Data according ETA-05/0255, issue 2011-06-23							
Anchor size		M8	M10	M12	M16	M20	M24	M27	M30

	HAS-(E)-HCR [kN]	18,0	28,0	40,7	76,7	119,3	106,7	-	-

Design combined pull-out and concrete cone resistance $N_{Rd,p} = N_{Rd,c}^0 \cdot f_{B,p} \cdot f_{h,p}$

		Data according ETA-05/0255, issue 2011-06-23							
Anchor size		M8	M10	M12	M16	M20	M24	M27	M30
Typical embedment depth $h_{ef,typ}$ [mm]	80	90	110	125	170	200	210	270	
$N_{Rd,p}^0$ Temperature range I [kN]	16,7	23,3	33,3	40,0	76,7	93,3	133,3	166,7	
$N_{Rd,p}^0$ Temperature range II [kN]	13,3	16,7	26,7	33,3	50,0	76,7	93,3	113,3	
$N_{Rd,p}^0$ Temperature range III [kN]	6,0	8,0	10,7	16,7	26,7	40,0	50,0	50,0	

Design concrete cone resistance $N_{Rd,c} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{h,N} \cdot f_{re,N}$

Design splitting resistance ^{a)} $N_{Rd,sp} = N_{Rd,sp}^0 \cdot f_B \cdot f_{h,N} \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{re,N}$

Anchor size	Data according ETA-05/0255, issue 2011-06-23							
	M8	M10	M12	M16	M20	M24	M27	M30
$N_{Rd,c}^0$ [kN]	24,1	28,7	38,8	47,1	74,6	102,5	125,2	149,4

a) Splitting resistance must only be considered for non-cracked concrete

Influencing factors

Influence of concrete strength on combined pull-out and concrete cone resistance

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_{B,p} = (f_{ck,cube}/25\text{N/mm}^2)^{0,14}$ a)	1	1,03	1,06	1,09	1,10	1,12	1,13

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of embedment depth on combined pull-out and concrete cone resistance

$$f_{h,p} = 1$$

Influence of concrete strength on concrete cone resistance

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25\text{N/mm}^2)^{1/2}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of edge distance ^{a)}

$c/c_{cr,N}$	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$c/c_{cr,sp}$										
$f_{1,N} = 0,7 + 0,3 \cdot c/c_{cr,N}$	0,73	0,76	0,79	0,82	0,85	0,88	0,91	0,94	0,97	1
$f_{1,sp} = 0,7 + 0,3 \cdot c/c_{cr,sp}$										
$f_{2,N} = 0,5 \cdot (1 + c/c_{cr,N})$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{2,sp} = 0,5 \cdot (1 + c/c_{cr,sp})$										

a) The the edge distance shall not be smaller than the minimum edge distance c_{min} given in the table with the setting details. These influencing factors must be considered for every edge distance smaller than the critical edge distance.

Influence of anchor spacing ^{a)}

$s/s_{cr,N}$	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$s/s_{cr,sp}$										
$f_{3,N} = 0,5 \cdot (1 + s/s_{cr,N})$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{3,sp} = 0,5 \cdot (1 + s/s_{cr,sp})$										

a) The anchor spacing shall not be smaller than the minimum anchor spacing s_{min} given in the table with the setting details. This influencing factor must be considered for every anchor spacing.

Influence of embedment depth on concrete cone resistance

$$f_{h,N} = 1$$

Influence of reinforcement

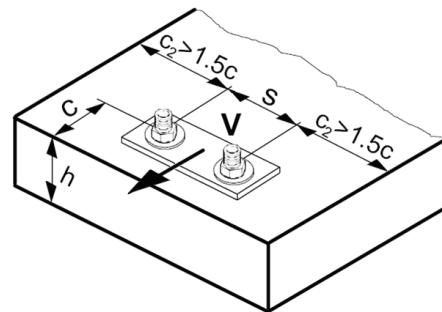

h_{ef} [mm]	40	50	60	70	80	90	≥ 100
$f_{re,N} = 0,5 + h_{ef}/200\text{mm} \leq 1$	0,7 a)	0,75 a)	0,8 a)	0,85 a)	0,9 a)	0,95 a)	1

a) This factor applies only for dense reinforcement. If in the area of anchorage there is reinforcement with a spacing ≥ 150 mm (any diameter) or with a diameter ≤ 10 mm and a spacing ≥ 100 mm, then a factor $f_{re} = 1$ may be applied.

Shear loading

The design shear resistance is the lower value of

- Steel resistance: $V_{Rd,s}$
- Concrete prout resistance: $V_{Rd,cp} = k \cdot \text{lower value of } N_{Rd,p} \text{ and } N_{Rd,c}$
- Concrete edge resistance: $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_\beta \cdot f_h \cdot f_4$

Basic design shear resistance

Design steel resistance $V_{Rd,s}$

a) The anchor spacing and the edge distance shall not be smaller than the minimum anchor spacing s_{\min} and the minimum edge distance c_{\min} .

Influence of embedment depth

Anchor size	M8	M10	M12	M16	M20	M24	M27	M30
$f_{\text{hef}} = 0,05 \cdot (h_{\text{ef}} / d)^{1,68}$	2,39	2	2,07	1,58	1,82	1,91	1,96	2

Influence of edge distance ^{a)}

c/d	4	6	8	10	15	20	30	40
$f_c = (d / c)^{0,19}$	0,77	0,71	0,67	0,65	0,60	0,57	0,52	0,50

a) The edge distance shall not be smaller than the minimum edge distance c_{\min} .

Combined tension and shear loading

For combined tension and shear loading see section "Anchor Design".

Precalculated values

Recommended loads can be calculated by dividing the design resistance by an overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Approvals / certificates

Description	Authority / Laboratory	No. / date of issue
European technical approval ^{a)}	DIBt, Berlin	ETA-05/0255 / 2011-06-23
Fire test report	IBMB, Braunschweig	UB-3333/0891-1 / 2004-03-26
Assessment report (fire)	warringtonfire	WF 327804/B / 2013-07-10

a) All data given in this section according ETA-05/0255, issue 2011-06-23.

Basic loading data (for a single anchor)

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Steel failure
- Screw strength class 8.8
- Base material thickness, as specified in the table
- One typical embedment depth, as specified in the table
- One anchor material, as specified in the tables
- Concrete C 20/25, $f_{ck,cube} = 25 \text{ N/mm}^2$
- Temperate range I
(min. base material temperature -40°C, max. long term/short term base material temperature: +24°C/40°C)
- Installation temperature range -5°C to +40°C

For details see Simplified design method

**Embedment depth and base material thickness for the basic loading data.
Mean ultimate resistance, characteristic resistance, design resistance, recommended loads.**

Anchor size	M8	M10	M12	M16	M20
Embedment depth [mm]	90	110	125	170	205
Base material thickness [mm]	120	150	180	250	350

Mean ultimate resistance: concrete C 20/25 – $f_{ck,cube} = 25 \text{ N/mm}^2$, anchor HIS-N

Data according ETA-05/0255, issue 2011-06-23					
Anchor size	M8	M10	M12	M16	M20
Tensile $N_{Ru,m}$ HIS-N [kN]	26,3	48,3	70,4	123,9	114,5
Shear $V_{Ru,m}$ HIS-N [kN]	13,7	24,2	41,0	62,0	57,8

Characteristic resistance: concrete C 20/25 – $f_{ck,cube} = 25 \text{ N/mm}^2$, anchor HIS-N

Data according ETA-05/0255, issue 2011-06-23					
Anchor size	M8	M10	M12	M16	M20
Tensile N_{Rk} HIS-N [kN]	25,0	40,0	60,0	95,0	109,0
Shear V_{Rk} HIS-N [kN]	13,0	23,0	39,0	59,0	55,0

Design resistance: concrete C 20/25 – $f_{ck,cube} = 25 \text{ N/mm}^2$, anchor HIS-N

Data according ETA-05/0255, issue 2011-06-23					
Anchor size	M8	M10	M12	M16	M20
Tensile N_{Rd} HIS-N [kN]	16,7	26,7	40,0	63,3	74,1
Shear V_{Rd} HIS-N [kN]	10,4	18,4	26,0	39,3	36,7

Recommended loads ^{a)}: concrete C 20/25 – $f_{ck,cube} = 25 \text{ N/mm}^2$, anchor HIS-N

Data according ETA-05/0255, issue 2011-06-23					
Anchor size	M8	M10	M12	M16	M20
Tensile N_{rec} HIS-N [kN]	11,9	19,0	28,6	45,2	53,0
Shear V_{rec} HIS-N [kN]	7,4	13,1	18,6	28,1	26,2

a) With overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Service temperature range

Hilti HVU adhesive may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

Temperature range	Base material temperature	Maximum long term base material temperature	Maximum short term base material temperature
Temperature range I	-40 °C to +40 °C	+24 °C	+40 °C
Temperature range II	-40 °C to +80 °C	+50 °C	+80 °C
Temperature range III	-40 °C to +120 °C	+72 °C	+120 °C

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

Materials

Mechanical properties of HIS-(R)N

		Data according ETA-05/0255, issue 2011-06-23

Rotary hammer	TE1 – TE30	TE1 – TE60	TE1 – TE80	TE50 – TE80	TE60 – TE80
Other tools	blow out pump or compressed air gun, setting tools				

Setting instruction

Dry and water-saturated concrete, hammer drilling

For detailed information on installation see instruction for use given with the package of the product.

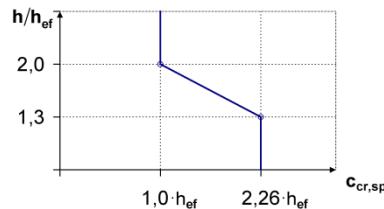

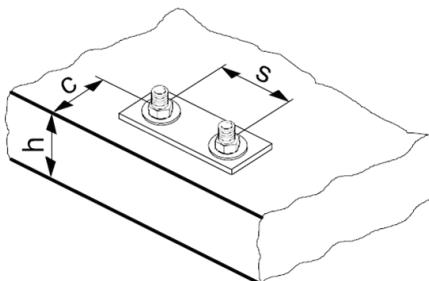

For technical data for anchors in diamond drilled holes please contact the Hilti Technical advisory service.

Curing time for general conditions

Data according ETA-05/0255, issue 2011-06-23	
Temperature of the base material	Curing time before anchor can be fully loaded t_{cure}
20 °C to 40 °C	20 min
10 °C to 19 °C	30 min
0 °C to 9 °C	1 h
-5 °C to -1 °C	5 h

Setting details

		Data according ETA-05/0255, issue 2011-06-23				
Anchor size	Sleeve HIS-(R)N foil capsule	M8x90 M10x90	M10x110 M12x110	M12x125 M16x125	M16x170 M20x170	M20x205 M24x210
Nominal diameter of drill bit	d_0 [mm]	14	18	22	28	32
Diameter of element	d [mm]	12,5	16,5	20,5	25,4	27,6
Effective anchorage and drill hole depth	h_{ef} [mm]	90	110	125	170	205
Minimum base material thickness	h_{\min} [mm]	120	150	170	230	270
Diameter of clearance hole in the fixture	d_f [mm]	9	12	14	18	22
Thread engagement length; min - max	h_s [mm]	8-20	10-25	12-30	16-40	20-50
Minimum spacing	s_{\min} [mm]	40	45	60	80	125
Minimum edge distance	c_{\min} [mm]	40	45	60	80	125
Critical spacing for splitting failure	$s_{\text{cr,sp}}$	2 $c_{\text{cr,sp}}$				
Critical edge distance for splitting failure a)	$c_{\text{cr,sp}}$ [mm]	$1,0 \cdot h_{\text{ef}}$ for $h / h_{\text{ef}} \geq 2,0$				
		$4,6 h_{\text{ef}} - 1,8 h$ for $2,0 > h / h_{\text{ef}} > 1,3$				
		$2,26 h_{\text{ef}}$ for $h / h_{\text{ef}} \leq 1,3$				
Critical spacing for concrete cone failure	$s_{\text{cr,N}}$	2 $c_{\text{cr,N}}$				
Critical edge distance for concrete cone failure	$c_{\text{cr,N}}$	1,5 h_{ef}				
Torque moment b)	T_{\max} [Nm]	10	20	40	80	150

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced.

- a) h: base material thickness ($h \geq h_{\min}$)
- b) This is the maximum recommended torque moment to avoid splitting failure during installation for anchors with minimum spacing and/or edge distance.

Simplified design method

Simplified version of the design method according EOTA Technical Report TR 029. Design resistance according data given in ETA-05/0255, issue 2011-06-23.

- Influence of concrete strength
- Influence of edge distance
- Influence of spacing
- Valid for a group of two anchors. (The method may also be applied for anchor groups with more than two anchors or more than one edge distance. The influencing factors must then be considered for each edge distance and spacing. The calculated design loads are then on the same side: They will be lower than the exact values according EOTA Technical Report TR 029. To avoid this, it is recommended to use the anchor design software PROFIS anchor)

The design method is based on the following simplification:

- No different loads are acting on individual anchors (no eccentricity)

The values are valid for one anchor.

For more complex fastening applications please use the anchor design software PROFIS Anchor.

Tension loading

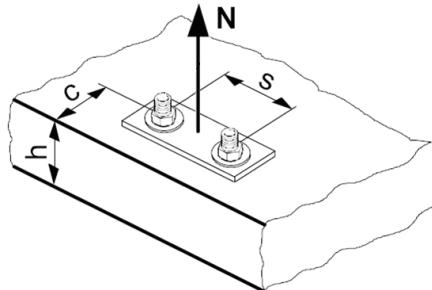

The design tensile resistance is the lower value of

- Steel resistance: $N_{Rd,s}$

- Combined pull-out and concrete cone resistance: $N_{Rd,p} = N_{Rd,c}^0 \cdot f_{B,p} \cdot f_{h,p}$

- Concrete cone resistance: $N_{Rd,c} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,N} \cdot f_{re,N}$

- Concrete splitting resistance (only non-cracked concrete): $N_{Rd,sp} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,sp} \cdot f_{re,N}$

Basic design tensile resistance

Design steel resistance $N_{Rd,s}$

		Data according ETA-05/0255, issue 2011-06-23				
Anchor size		M8	M10	M12	M16	M20
$N_{Rd,s}$	HIS-N [kN]	17,5	30,7	44,7	80,3	74,1
	HIS-RN [kN]	13,9	21,9	31,6	58,8	69,2

Design combined pull-out and concrete cone resistance $N_{Rd,p} = N_{Rd,c}^0 \cdot f_{B,p} \cdot f_{h,p}$

		Data according ETA-05/0255, issue 2011-06-23				
Anchor size		M8	M10	M12	M16	M20
Embedment depth h_{ef} [mm]		90	110	125	170	205
$N_{Rd,p}^0$ Temperature range I [kN]		16,7	26,7	40,0	63,3	93,3
$N_{Rd,p}^0$ Temperature range II [kN]		13,3	23,3	33,3	50,0	63,3
$N_{Rd,p}^0$ Temperature range III [kN]		6,0	10,7	13,3	26,7	33,3

Design concrete cone resistance $N_{Rd,c} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,N} \cdot f_{re,N}$

Design splitting resistance ^{a)} $N_{Rd,sp} = N_{Rd,c}^0 \cdot f_B \cdot f_{h,N} \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{re,N}$

		Data according ETA-05/0255, issue 2011-06-23				
Anchor size		M8	M10	M12	M16	M20
$N_{Rd,c}^0$	[kN]	28,7	38,8	47,1	74,6	98,8

a) Splitting resistance must only be considered for non-cracked concrete

Influencing factors

Influence of concrete strength on combined pull-out and concrete cone resistance

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_{B,p} = (f_{ck,cube}/25N/mm^2)^{0,28}$ a)	1	1,05	1,12	1,18	1,21	1,25	1,28

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of embedment depth on combined pull-out and concrete cone resistance

$$f_{h,p} = 1$$

Influence of concrete strength on concrete cone resistance

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25N/mm^2)^{1/2}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of edge distance a)

c/c _{cr,N}	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
c/c _{cr,sp}										
$f_{1,N} = 0,7 + 0,3 \cdot c/c_{cr,N}$	0,73	0,76	0,79	0,82	0,85	0,88	0,91	0,94	0,97	1
$f_{1,sp} = 0,7 + 0,3 \cdot c/c_{cr,sp}$										
$f_{2,N} = 0,5 \cdot (1 + c/c_{cr,N})$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{2,sp} = 0,5 \cdot (1 + c/c_{cr,sp})$										

a) The the edge distance shall not be smaller than the minimum edge distance c_{min} given in the table with the setting details. These influencing factors must be considered for every edge distance smaller than the critical edge distance.

Influence of anchor spacing a)

s/s _{cr,N}	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
s/s _{cr,sp}										
$f_{3,N} = 0,5 \cdot (1 + s/s_{cr,N})$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{3,sp} = 0,5 \cdot (1 + s/s_{cr,sp})$										

a) The anchor spacing shall not be smaller than the minimum anchor spacing s_{min} given in the table with the setting details. This influencing factor must be considered for every anchor spacing.

Influence of embedment depth on concrete cone resistance

$$f_{h,N} = 1$$

Influence of reinforcement

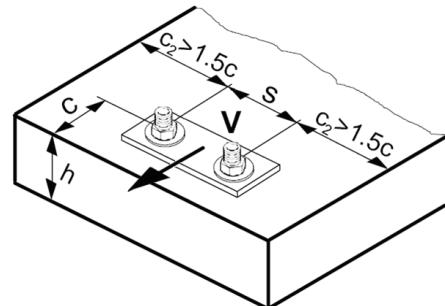

h _{ef} [mm]	80	90	≥ 100
$f_{re,N} = 0,5 + h_{ef}/200mm \leq 1$	0,9 a)	0,95 a)	1

a) This factor applies only for dense reinforcement. If in the area of anchorage there is reinforcement with a spacing ≥ 150 mm (any diameter) or with a diameter ≤ 10 mm and a spacing ≥ 100 mm, then a factor $f_{re} = 1$ may be applied.

Shear loading

The design shear resistance is the lower value of

- Steel resistance: $V_{Rd,s}$
- Concrete prout resistance: $V_{Rd,cp} = k \cdot \text{lower value of } N_{Rd,p} \text{ and } N_{Rd,c}$
- Concrete edge resistance: $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_B \cdot f_h \cdot f_4$

Basic design shear resistance

Design steel resistance $V_{Rd,s}$

		Data according ETA-05/0255, issue 2011-06-23				
Anchor size		M8	M10	M12	M16	M20
V _{Rd,s}	HIS-N [kN]	10,4	18,4	26,0	39,3	36,7
	HIS-RN [kN]	8,3	12,8	19,2	35,3	41,5

Design concrete prout resistance $V_{Rd,cp} = k \cdot N_{Rd,c}$ ^{a)}

Anchor size	M8	M10	M12	M16	M20
k			2		

a) $N_{Rd,c}$: Design concrete cone resistance

Design concrete edge resistance $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_B \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Anchor size	M8	M10	M12	M16	M20
$V_{Rd,c}^0$ [kN]	12,4	19,8	28,4	40,7	46,8

a) For anchor groups only the anchors close to the edge must be considered.

Influencing factors

Influence of concrete strength

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25\text{N/mm}^2)^{1/2}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of angle between load applied and the direction perpendicular to the free edge

Angle β	0°	10°	20°	30°	40°	50°	60°	70°	80°	≥ 90°

a) All data given in this section according ETA-07/0260, issue 2013-06-26.

Basic loading data (for a single anchor)

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Steel failure
- Base material thickness, as specified in the table
- One typical embedment depth, as specified in the table
- One anchor material, as specified in the tables
- Concrete C 20/25, $f_{ck,cube} = 25 \text{ N/mm}^2$
- Temperate range I
(min. base material temperature -40°C, max. long term/short term base material temperature: +24°C/40°C)
- Installation temperature range +5°C to +40°C

For details see Simplified design method

Embedment depth ^{a)} and base material thickness for the basic loading data.

Mean ultimate resistance, characteristic resistance, design resistance, recommended loads.

Anchor size	M8	M10	M12	M16	M20	M24	M27	M30
Typical embedment depth [mm]	80	90	110	125	170	210	240	270
Base material thickness [mm]	110	120	140	165	220	270	300	340

a) The allowed range of embedment depth is shown in the setting details. The corresponding load values can be calculated according to the simplified design method.

Mean ultimate resistance: concrete C 20/25 – $f_{ck,cube} = 25 \text{ N/mm}^2$, anchor HIT-V 5.8

a) With overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Service temperature range

Hilti HIT-RE 500-SD injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

Temperature range	Base material temperature	Maximum long term base material temperature	Maximum short term base material temperature
Temperature range I	-40 °C to +40 °C	+24 °C	+40 °C
Temperature range II	-40 °C to +58 °C	+35 °C	+58 °C
Temperature range III	-40 °C to +70 °C	+43 °C	+70 °C

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

Setting

Installation equipment

Anchor size	M8	M10	M12	M16	M20	M24	M27	M30
Rotary hammer			TE2 – TE16				TE40 – TE70	
Other tools								compressed air gun or blow out pump, set of cleaning brushes, dispenser

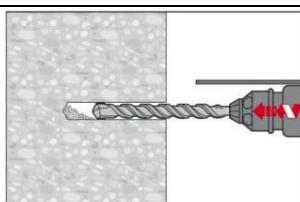

Setting instruction

Bore hole drilling

Drill hole to the required embedment depth with an appropriately sized Hilti TE-CD or TE-YD hollow drill bit with Hilti vacuum attachment. This drilling system removes the dust and cleans the borehole during drilling when using in accordance with the user's manual.

After drilling is complete, proceed to the "injection preparation" step in the instructions for use.

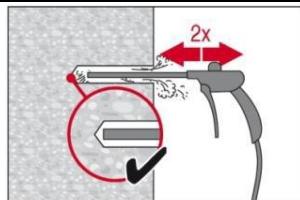

Drill Hole to the required embedment depth with a hammer drill set in rotation-hammer mode using an appropriately sized carbide drill bit.

Bore hole cleaning

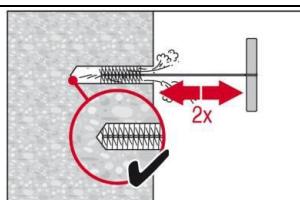

Just before setting an anchor, the bore hole must be free of dust and debris.

Compressed air cleaning (CAC) for all bore hole diameters d_0 and all bore hole depth h_0

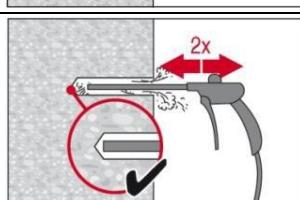

Blow 2 times from the back of the hole (if needed with nozzle extension) over the hole length with oil-free compressed air (min. 6 bar at 6 m³/h) until return air stream is free of noticeable dust.

Bore hole diameter ≥ 32 mm the compressor must supply a minimum air flow of 140 m³/hour.

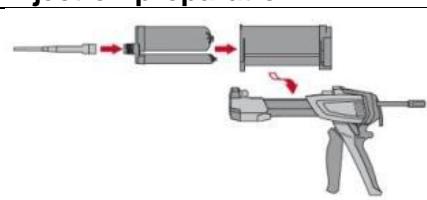

Brush 2 times with the specified brush size by inserting the steel brush Hilti HIT-RB to the back of the hole (if needed with extension) in a twisting motion and removing it.

The brush must produce natural resistance as it enters the bore hole -- if not the brush is too small and must be replaced with the proper brush diameter.

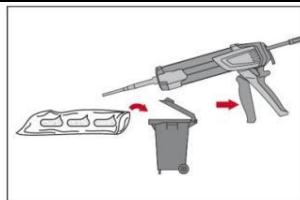

Blow again with compressed air 2 times until return air stream is free of noticeable dust.

Injection preparation

Tightly attach new Hilti mixing nozzle HIT-RE-M to foil pack manifold (snug fit). Do not modify the mixing nozzle.

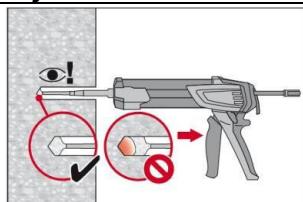

Observe the instruction for use of the dispenser and the mortar. Check foil pack holder for proper function. Do not use damaged foil packs / holders. Insert foil pack into foil pack holder and put holder into HIT-dispenser.

The foil pack opens automatically as dispensing is initiated. Discard initial adhesive. Depending on the size of the foil pack an initial amount of adhesive has to be discarded.

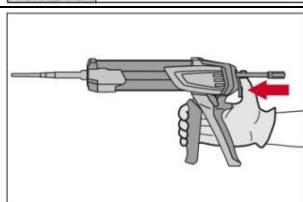

Discard quantities are:

- 3 strokes for 330 ml foil pack,
- 4 strokes for 500 ml foil pack,
- 65 ml for 1400 ml foil pack $\leq 5^{\circ}\text{C}$.

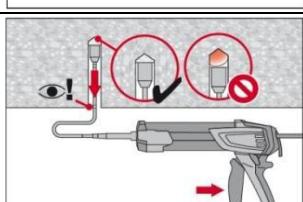

Inject adhesive from the back of the borehole without forming air voids

Inject the adhesive starting at the back of the hole, slowly withdrawing the mixer with each trigger pull.

Fill holes approximately 2/3 full. It is required that the annular gap between the anchor and the concrete is completely filled with adhesive along the embedment length.

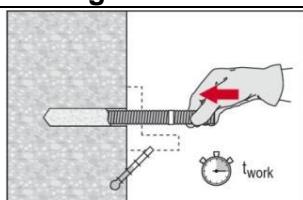

After injection is completed, depressurize the dispenser by pressing the release trigger. This will prevent further adhesive discharge from the mixer.

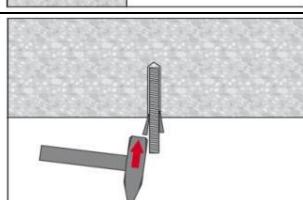

Overhead installation and/or installation with embedment depth $h_{ef} > 250\text{mm}$.

For overhead installation the injection is only possible with the aid of extensions and piston plugs. Assemble HIT-RE-M mixer, extension(s) and appropriately sized piston plug (HIT-SZ). Insert piston plug to back of the hole and inject adhesive. During injection the piston plug will be naturally extruded out of the bore hole by the adhesive pressure.

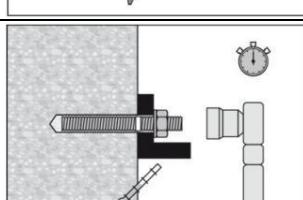

Setting the element

Before use, verify that the element is dry and free of oil and other contaminants.

Mark and set element to the required embedment depth until working time t_{work} has elapsed.

For overhead installation use piston plugs and fix embedded parts with e.g. wedges HIT-OHW.

Loading the anchor:

After required curing time t_{cure} the anchor can be loaded.

The applied installation torque shall not exceed given T_{max} .

For detailed information on installation see instruction for use given with the package of the product.

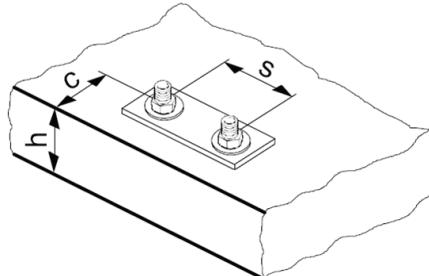

Curing time for general conditions

Data according ETA-07/0260, issue 2013-06-26

Temperature of the base material	Working time in which anchor can be inserted and adjusted t_{gel}	Curing time before anchor can be fully loaded t_{cure}
40 °C	12 min	4 h
30 °C to 39 °C	12 min	8 h
20 °C to 29 °C	20 min	12 h
15 °C to 19 °C	30 min	24 h
10 °C to 14 °C	90 min	48 h
5 °C to 9 °C	120 min	72 h

Setting details

		Data according ETA-07/0260, issue 2013-06-26							
Anchor size		M8	M10	M12	M16	M20	M24	M27	M30
Nominal diameter of drill bit	d_0 [mm]	10	12	14	18	24	28	30	35
Effective anchorage and drill hole depth range ^{a)}	$h_{\text{ef,min}}$ [mm]	40	40	48	64	80	96	108	120
	$h_{\text{ef,max}}$ [mm]	160	200	240	320	400	480	540	600
Minimum base material thickness	h_{\min} [mm]	$h_{\text{ef}} + 30 \text{ mm}$ $\geq 100 \text{ mm}$		$h_{\text{ef}} + 2 d_0$					
Diameter of clearance hole in the fixture	d_f [mm]	9	12	14	18	22	26	30	33
Minimum spacing	s_{\min} [mm]	40	50	60	80	100	120	135	150
Minimum edge distance	c_{\min} [mm]	40	50	60	80	100	120	135	150
Critical spacing for splitting failure	$s_{\text{cr,sp}}$	$2 c_{\text{cr,sp}}$							
Critical edge distance for splitting failure ^{b)}	$c_{\text{cr,sp}}$ [mm]	$1,0 \cdot h_{\text{ef}}$ for $h / h_{\text{ef}} \geq 2,0$							
		$4,6 h_{\text{ef}} - 1,8 h$ for $2,0 > h / h_{\text{ef}} > 1,3$							
		$2,26 h_{\text{ef}}$ for $h / h_{\text{ef}} \leq 1,3$							
Critical spacing for concrete cone failure	$s_{\text{cr,N}}$	$2 c_{\text{cr,N}}$							
Critical edge distance for concrete cone failure ^{c)}	$c_{\text{cr,N}}$	$1,5 h_{\text{ef}}$							
Torque moment ^{d)}	T_{\max} [Nm]	10	20	40	80	150	200	270	300

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced.

- a) $h_{\text{ef,min}} \leq h_{\text{ef}} \leq h_{\text{ef,max}}$ (h_{ef} : embedment depth)
- b) h : base material thickness ($h \geq h_{\min}$)
- c) The critical edge distance for concrete cone failure depends on the embedment depth h_{ef} and the design bond resistance. The simplified formula given in this table is on the safe side.
- d) This is the maximum recommended torque moment to avoid splitting failure during installation for anchors with minimum spacing and/or edge distance.

Simplified design method

Simplified version of the design method according ETAG 001, TR 029. Design resistance according data given in ETA-07/0260, issue 2013-06-26.

- Influence of concrete strength
- Influence of edge distance
- Influence of spacing
- Valid for a group of two anchors. (The method may also be applied for anchor groups with more than two anchors or more than one edge distance. The influencing factors must then be considered for each edge distance and spacing. The calculated design loads are then on the same side: They will be lower than the exact values according ETAG 001, TR 029. To avoid this, it is recommended to use the anchor design software PROFIS anchor)

The design method is based on the following simplification:

- No different loads are acting on individual anchors (no eccentricity)

The values are valid for one anchor.

For more complex fastening applications please use the anchor design software PROFIS Anchor.

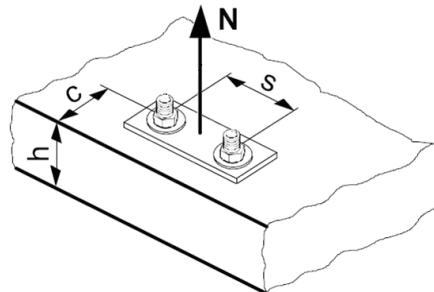

Tension loading

The design tensile resistance is the lower value of

- Steel resistance: $N_{Rd,s}$
- Combined pull-out and concrete cone resistance:

$$N_{Rd,p} = N_{Rd,c}^0 \cdot f_{B,p} \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,p} \cdot f_{re,N}$$
- Concrete cone resistance: $N_{Rd,c} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,N} \cdot f_{re,N}$
- Concrete splitting resistance (only non-cracked concrete):

$$N_{Rd,sp} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,N} \cdot f_{re,N}$$

Basic design tensile resistance

a) Splitting resistance must only be considered for non-cracked concrete

Influencing factors

Influence of concrete strength on combined pull-out and concrete cone resistance

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_{B,p} = (f_{ck,cube}/25N/mm^2)^{0,1}$ a)	1	1,02	1,04	1,06	1,07	1,08	1,09

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of embedment depth on combined pull-out and concrete cone resistance

$$f_{h,p} = h_{ef}/h_{ef,typ}$$

Influence of concrete strength on concrete cone resistance

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25N/mm^2)^{1/2}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of edge distance ^{a)}

$c/c_{cr,N}$	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$c/c_{cr,sp}$										
$f_{1,N} = 0,7 + 0,3 \cdot c/c_{cr,N}$	0,73	0,76	0,79	0,82	0,85	0,88	0,91	0,94	0,97	1
$f_{1,sp} = 0,7 + 0,3 \cdot c/c_{cr,sp}$										
$f_{2,N} = 0,5 \cdot (1 + c/c_{cr,N})$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{2,sp} = 0,5 \cdot (1 + c/c_{cr,sp})$										

- a) The the edge distance shall not be smaller than the minimum edge distance c_{min} given in the table with the setting details. These influencing factors must be considered for every edge distance smaller than the critical edge distance.

Influence of anchor spacing ^{a)}

$s/s_{cr,N}$	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$s/s_{cr,sp}$										
$f_{3,N} = 0,5 \cdot (1 + s/s_{cr,N})$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{3,sp} = 0,5 \cdot (1 + s/s_{cr,sp})$										

- a) The anchor spacing shall not be smaller than the minimum anchor spacing s_{min} given in the table with the setting details. This influencing factor must be considered for every anchor spacing.

Influence of embedment depth on concrete cone resistance

$$f_{h,N} = (h_{ef}/h_{ef,typ})^{1,5}$$

Influence of reinforcement

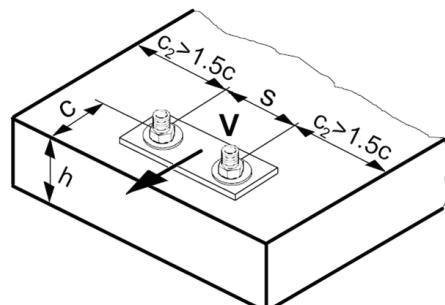

h_{ef} [mm]	40	50	60	70	80	90	≥ 100
$f_{re,N} = 0,5 + h_{ef}/200\text{mm} \leq 1$	0,7 ^{a)}	0,75 ^{a)}	0,8 ^{a)}	0,85 ^{a)}	0,9 ^{a)}	0,95 ^{a)}	1

- a) This factor applies only for dense reinforcement. If in the area of anchorage there is reinforcement with a spacing ≥ 150 mm (any diameter) or with a diameter ≤ 10 mm and a spacing ≥ 100 mm, then a factor $f_{re} = 1$ may be applied.

Shear loading

The design shear resistance is the lower value of

- Steel resistance: $V_{Rd,s}$
- Concrete prout resistance: $V_{Rd,cp} = k \cdot \text{lower value of } N_{Rd,p} \text{ and } N_{Rd,c}$
- Concrete edge resistance: $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_\beta \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Basic design shear resistance

Design steel resistance $V_{Rd,s}$

Anchor size	Data according ETA-07/0260, issue 2013-06-26

Influence of edge distance ^{a)}

c/d	4	6	8	10	15	20	30	40
$f_c = (d / c)^{0,19}$	0,77	0,71	0,67	0,65	0,60	0,57	0,52	0,50

a) The edge distance shall not be smaller than the minimum edge distance c_{\min} .

Combined tension and shear loading

For combined tension and shear loading see section "Anchor Design".

Precalculated values

Recommended loads can be calculated by dividing the design resistance by an overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Seismic design C1

Basic loading data for concrete C20/25 – C50/60

All data in this section applies to:

- Seismic design according to TR045

The following technical data are based on: ETA-07/0260, issue 2013-06-26

Anchorage depth range

Anchor size	M8	M10	M12	M16	M20	M24	M27	M30	
Effective anchorage depth range	$h_{ef,min}$ [mm]	40	40	48	64	80	96	108	120
	$h_{ef,max}$ [mm]	160	200	240	320	400	480	540	600

Tension resistance in case of seismic performance category C1

Anchor size	M8	M10	M12	M16	M20	M24	M27	M30	
Characteristic tension resistance to steel failure									
HIT-V-5.8(F)	$N_{Rk,s,seis}$ [kN]	18	29	42	79	123	177	230	281
HIT-V-8.8(F)	$N_{Rk,s,seis}$ [kN]	29	46	67	126	196	282	367	449
Partial safety factor	$\gamma_{Ms,seis}$ [-]				1,5				
HIT-V-R	$N_{Rk,s,seis}$ [kN]	26	41	59	110	172	247	230	281
Partial safety factor	$\gamma_{Ms,seis}$ [-]				1,87			2,86	
HIT-V-HCR	$N_{Rk,s,seis}$ [kN]	29	46	67	126	196	247	321	393
Partial safety factor	$\gamma_{Ms,seis}$ [-]				1,5			2,1	

Characteristic bond resistance in cracked concrete C20/25 to C50/60

Temperature range I: 40°C/24°C	$\tau_{Rk,seis}$ [N/mm ²]	6,4	6,4	6	5,3	5	4,6	4,1	3,6
Temperature range II: 58°C/35°C	$\tau_{Rk,seis}$ [N/mm ²]	5,2	4,8	4,8	4,5	3,9	3,6	3,1	3
Temperature range III: 70°C/43°C	$\tau_{Rk,seis}$ [N/mm ²]	3,2	2,8	2,8	2,6	2,1	2	1,9	1,8
Partial safety factor	$\gamma_{Mp,seis}$ [-]			1,8			2,1		

Concrete cone resistance and splitting resistance

Partial safety factor	$\gamma_{Mc,seis} = \gamma_{Msp,seis}$ [-]	1,8		2,1				
-----------------------	--	-----	--	-----	--	--	--	--

Displacement under tension load in case of seismic performance category C1 ¹⁾

Anchor size	M8	M10	M12	M16	M20	M24	M27	M30	
Displacement ¹⁾	$\delta_{N,seis}$ [mm]	1,5	1,7	1,9	2,3	2,7	3,1	3,4	3,7

1) Maximum displacement during cycling (seismic event).

Shear resistance in case of seismic performance category C1

Anchor size	M8	M10	M12	M16	M20	M24	M27	M30
Characteristic shear resistance to steel failure								
for HIT-V-5.8(F) $V_{Rk,s,seis}$ [kN]	6	11	15	27	43	62	81	98
for HIT-V-8.8(F) $V_{Rk,s,seis}$ [kN]	11	16	24	44	69	99	129	157
Partial safety factor $\gamma_{Ms,seis}$ [-]				1,25				
for HIT-V-R $V_{Rk,s,seis}$ [kN]	9	14	21	39	60	87	81	98
Partial safety factor $\gamma_{Ms,seis}$ [-]				1,56				2,38
for HIT-V-HCR $V_{Rk,s,seis}$ [kN]	11	16	24	44	69	87	113	137
Partial safety factor $\gamma_{Ms,seis}$ [-]				1,25				1,75
Concrete pryout resistance and concrete edge resistance								
Partial safety factor $\gamma_{Mcp,seis} = \gamma_{Mc,seis}$ [-]					1,5			

Displacement under shear load in case of seismic performance category C1 ¹⁾

Anchor size	M8	M10	M12	M16	M20	M24	M27	M30
Displacement ¹⁾ $\delta_{V,seis}$ [mm]	3,2	3,5	3,8	4,4	5,0	5,6	6,1	6,5

1) Maximum displacement during cycling (seismic event).

For seismic resistant fastening applications please use the anchor design software PROFIS Anchor.

Hilti HIT-RE 500-SD mortar with HIS-(R)N sleeve

Injection mortar system	Benefits
  	<p>Hilti HIT-RE 500-SD 330 ml foil pack (also available as 500 ml and 1400 ml foil pack)</p> <p>Statik mixer</p> <p>HIS-(R)N sleeve</p> <ul style="list-style-type: none"> - SAFEset technology: drilling and borehole cleaning in one step with Hilti hollow drill bit - suitable for cracked and non-cracked concrete C 20/25 to C 50/60 - ETA seismic approval C1 - high loading capacity - suitable for dry and water saturated concrete - long working time at elevated temperatures - odourless epoxy

a) All data given in this section according ETA-07/0260, issue 2013-06-26.

Basic loading data (for a single anchor)

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Steel failure
- Screw strength class 8.8
- Base material thickness, as specified in the table
- One typical embedment depth, as specified in the table
- One anchor material, as specified in the tables
- Concrete C 20/25, $f_{ck,cube} = 25 \text{ N/mm}^2$
- Temperate range I
(min. base material temperature -40°C, max. long term/short term base material temperature: +24°C/40°C)
- Installation temperature range +5°C to +40°C

For details see Simplified design method

Embedment depth and base material thickness for the basic loading data.

Mean ultimate resistance, characteristic resistance, design resistance, recommended loads.

Anchor size	M8	M10	M12	M16	M20
Embedment depth [mm]	90	110	125	170	205
Base material thickness [mm]	120	150	170	230	270

Mean ultimate resistance: concrete C 20/25 – $f_{ck,cube} = 25 \text{ N/mm}^2$, anchor HIS-N

Anchor size	Data according ETA-07/0260, issue 2013-06-26

a) With overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Service temperature range

Hilti HIT-RE 500-SD injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

Temperature range	Base material temperature	Maximum long term base material temperature	Maximum short term base material temperature
Temperature range I	-40 °C to +40 °C	+24 °C	+40 °C
Temperature range II	-40 °C to +58 °C	+35 °C	+58 °C
Temperature range III	-40 °C to +70 °C	+43 °C	+70 °C

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

Setting

installation equipment

Anchor size	M8	M10	M12	M16	M20
Rotary hammer	TE 2 – TE 16			TE 40 – TE 70	
Other tools	compressed air gun or blow out pump, set of cleaning brushes, dispenser				

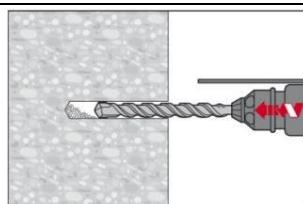

Setting instruction

Bore hole drilling

Drill hole to the required embedment depth with an appropriately sized Hilti TE-CD or TE-YD hollow drill bit with Hilti vacuum attachment. This drilling system removes the dust and cleans the borehole during drilling when using in accordance with the user's manual.

After drilling is complete, proceed to the "injection preparation" step in the instructions for use.

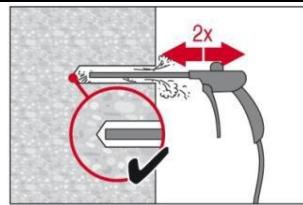

Drill Hole to the required embedment depth with a hammer drill set in rotation-hammer mode using an appropriately sized carbide drill bit.

Bore hole cleaning

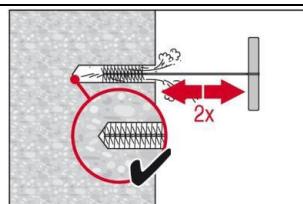

Just before setting an anchor, the bore hole must be free of dust and debris.

Compressed air cleaning (CAC) for all bore hole diameters d_0 and all bore hole depth h_0

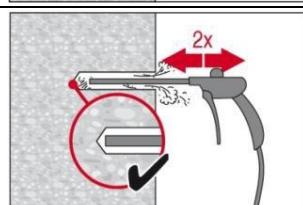

Blow 2 times from the back of the hole (if needed with nozzle extension) over the hole length with oil-free compressed air (min. 6 bar at 6 m³/h) until return air stream is free of noticeable dust.

Bore hole diameter ≥ 32 mm the compressor must supply a minimum air flow of 140 m³/hour.

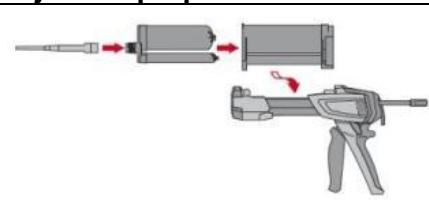

Brush 2 times with the specified brush size by inserting the steel brush Hilti HIT-RB to the back of the hole (if needed with extension) in a twisting motion and removing it.

The brush must produce natural resistance as it enters the bore hole -- if not the brush is too small and must be replaced with the proper brush diameter.

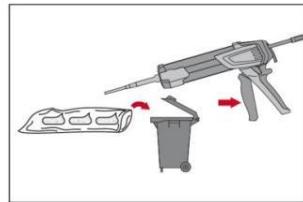

Blow again with compressed air 2 times until return air stream is free of noticeable dust.

Injection preparation

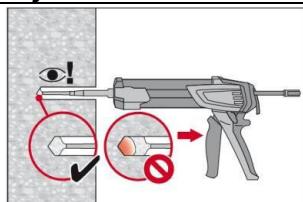

Tightly attach new Hilti mixing nozzle HIT-RE-M to foil pack manifold (snug fit). Do not modify the mixing nozzle.
Observe the instruction for use of the dispenser and the mortar. Check foil pack holder for proper function. Do not use damaged foil packs / holders. Insert foil pack into foil pack holder and put holder into HIT-dispenser.

The foil pack opens automatically as dispensing is initiated. Discard initial adhesive. Depending on the size of the foil pack an initial amount of adhesive has to be discarded.

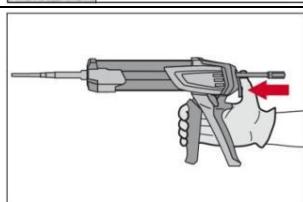

Discard quantities are:

- 3 strokes for 330 ml foil pack,
- 4 strokes for 500 ml foil pack,
- 65 ml for 1400 ml foil pack $\leq 5^{\circ}\text{C}$.

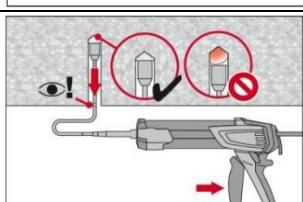

Inject adhesive from the back of the borehole without forming air voids

Inject the adhesive starting at the back of the hole, slowly withdrawing the mixer with each trigger pull.

Fill holes approximately 2/3 full It is required that the annular gap between the anchor and the concrete is completely filled with adhesive along the embedment length.

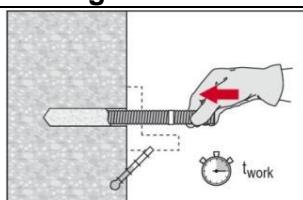

After injection is completed, depressurize the dispenser by pressing the release trigger. This will prevent further adhesive discharge from the mixer.

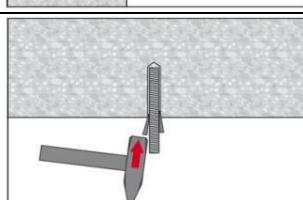

Overhead installation and/or installation with embedment depth $h_{ef} > 250\text{mm}$.

For overhead installation the injection is only possible with the aid of extensions and piston plugs. Assemble HIT-RE-M mixer, extension(s) and appropriately sized piston plug (HIT-SZ). Insert piston plug to back of the hole and inject adhesive. During injection the piston plug will be naturally extruded out of the bore hole by the adhesive pressure.

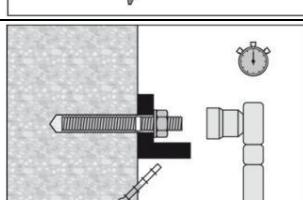

Setting the element

Before use, verify that the element is dry and free of oil and other contaminants.

Mark and set element to the required embedment depth until working time t_{work} has elapsed.

For overhead installation use piston plugs and fix embedded parts with e.g. wedges HIT-OHW.

Loading the anchor:

After required curing time t_{cure} the anchor can be loaded.

The applied installation torque shall not exceed given T_{max} .

For detailed information on installation see instruction for use given with the package of the product.

Curing time for general conditions

Data according ETA-07/0260, issue 2013-06-26

Temperature of the base material	Working time in which anchor can be inserted and adjusted t_{gel}	Curing time before anchor can be fully loaded t_{cure}
40 °C	12 min	4 h
30 °C to 39 °C	12 min	8 h
20 °C to 29 °C	20 min	12 h
15 °C to 19 °C	30 min	24 h
10 °C to 14 °C	90 min	48 h
5 °C to 9 °C	120 min	72 h

Setting details

		Data according ETA-07/0260, issue 2013-06-26				
Anchor size		M8	M10	M12	M16	M20
Nominal diameter of drill bit	d_0 [mm]	14	18	22	28	32
Diameter of element	d [mm]	12,5	16,5	20,5	25,4	27,6
Effective anchorage and drill hole depth	h_{ef} [mm]	90	110	125	170	205
Minimum base material thickness	h_{\min} [mm]	120	150	170	230	270
Diameter of clearance hole in the fixture	d_f [mm]	9	12	14	18	22

Minimum spacing	s_{\min} [mm]	40	45	55	65	90
Minimum edge distance	c_{\min} [mm]	40	45	55	65	90
Critical spacing for splitting failure	$s_{\text{cr,sp}}$	$2 c_{\text{cr,sp}}$				
Critical edge distance for splitting failure ^{a)}	$c_{\text{cr,sp}}$ [mm]	$1,0 \cdot h_{\text{ef}}$ for $h / h_{\text{ef}} \geq 2,0$				
		$4,6 h_{\text{ef}} - 1,8 h$ for $2,0 > h / h_{\text{ef}} > 1,3$				
		$2,26 h_{\text{ef}}$ for $h / h_{\text{ef}} \leq 1,3$				
Critical spacing for concrete cone failure	$s_{\text{cr,N}}$	$2 c_{\text{cr,N}}$				
Critical edge distance for concrete cone failure ^{b)}	$c_{\text{cr,N}}$	$1,5 h_{\text{ef}}$				
Torque moment ^{c)}	T_{\max} [Nm]	10	20	40	80	150

h / h_{ef}	$c_{\text{cr,sp}}$ [mm]
1,0	1,0 h_{ef}
2,0	2,0 h_{ef}
2,26	2,26 h_{ef}

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced.

- a) h: base material thickness ($h \geq h_{\min}$)
- b) The critical edge distance for concrete cone failure depends on the embedment depth h_{ef} and the design bond resistance. The simplified formula given in this table is on the save side.
- c) This is the maximum recommended torque moment to avoid splitting failure during installation for anchors with minimum spacing and/or edge distance.

Simplified design method

Simplified version of the design method according ETAG 001, TR 029. Design resistance according data given in ETA-07/0260, issue 2013-06-26.

- Influence of concrete strength
- Influence of edge distance
- Influence of spacing
- Valid for a group of two anchors. (The method may also be applied for anchor groups with more than two anchors or more than one edge distance. The influencing factors must then be considered for each edge distance and spacing. The calculated design loads are then on the same side: They will be lower than the exact values according ETAG 001, TR 029. To avoid this, it is recommended to use the anchor design software PROFIS anchor)

The design method is based on the following simplification:

- No different loads are acting on individual anchors (no eccentricity)

The values are valid for one anchor.

For more complex fastening applications please use the anchor design software PROFIS Anchor.

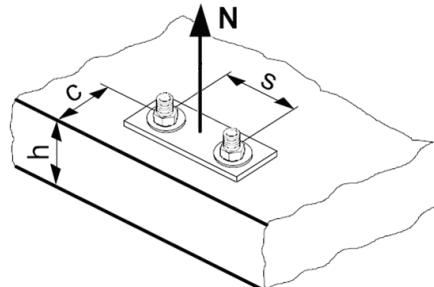

Tension loading

The design tensile resistance is the lower value of

- Steel resistance: $N_{Rd,s}$
- Combined pull-out and concrete cone resistance:

$$N_{Rd,p} = N_{Rd,c}^0 \cdot f_{B,p} \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,p} \cdot f_{re,N}$$
- Concrete cone resistance: $N_{Rd,c} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,N} \cdot f_{re,N}$
- Concrete splitting resistance (only non-cracked concrete):

$$N_{Rd,sp} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,N} \cdot f_{re,N}$$

Basic design tensile resistance

Influencing factors

Influence of concrete strength on combined pull-out and concrete cone resistance

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_{B,p} = (f_{ck,cube}/25N/mm^2)^{0,1}$ a)	1	1,02	1,04	1,06	1,07	1,08	1,09

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of embedment depth on combined pull-out and concrete cone resistance

$$f_{h,p} = 1$$

Influence of concrete strength on concrete cone resistance

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25N/mm^2)^{1/2}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of edge distance ^{a)}

$c/c_{cr,N}$	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$c/c_{cr,sp}$										
$f_{1,N} = 0,7 + 0,3 \cdot c/c_{cr,N}$	0,73	0,76	0,79	0,82	0,85	0,88	0,91	0,94	0,97	1
$f_{1,sp} = 0,7 + 0,3 \cdot c/c_{cr,sp}$										
$f_{2,N} = 0,5 \cdot (1 + c/c_{cr,N})$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{2,sp} = 0,5 \cdot (1 + c/c_{cr,sp})$										

- a) The the edge distance shall not be smaller than the minimum edge distance c_{min} given in the table with the setting details. These influencing factors must be considered for every edge distance smaller than the critical edge distance.

Influence of anchor spacing ^{a)}

$s/s_{cr,N}$	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$s/s_{cr,sp}$										
$f_{3,N} = 0,5 \cdot (1 + s/s_{cr,N})$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{3,sp} = 0,5 \cdot (1 + s/s_{cr,sp})$										

- a) The anchor spacing shall not be smaller than the minimum anchor spacing s_{min} given in the table with the setting details. This influencing factor must be considered for every anchor spacing.

Influence of embedment depth on concrete cone resistance

$$f_{h,N} = 1$$

Influence of reinforcement

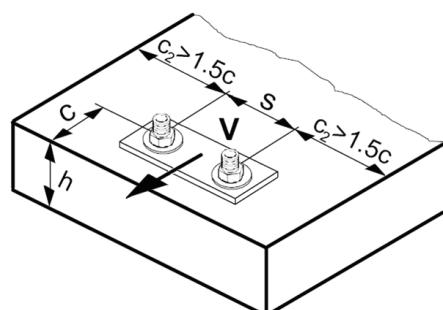

h_{ef} [mm]	80	90	≥ 100
$f_{re,N} = 0,5 + h_{ef}/200\text{mm} \leq 1$	0,9 ^{a)}	0,95 ^{a)}	1

- a) This factor applies only for dense reinforcement. If in the area of anchorage there is reinforcement with a spacing ≥ 150 mm (any diameter) or with a diameter ≤ 10 mm and a spacing ≥ 100 mm, then a factor $f_{re} = 1$ may be applied.

Shear loading

The design shear resistance is the lower value of

- Steel resistance: $V_{Rd,s}$
- Concrete prout resistance: $V_{Rd,cp} = k \cdot \text{lower value of } N_{Rd,p} \text{ and } N_{Rd,c}$
- Concrete edge resistance: $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_B \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Basic design shear resistance

Influence of embedment depth

Anchor size	M8	M10	M12	M16	M20
$f_{hef} =$	1,38	1,21	1,04	1,22	1,45

Influence of edge distance ^{a)}

c/d	4	6	8	10	15	20	30	40
$f_c = (d / c)^{0,19}$	0,77	0,71	0,67	0,65	0,60	0,57	0,52	0,50

a) The edge distance shall not be smaller than the minimum edge distance c_{min} .

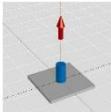

Combined tension and shear loading

For combined tension and shear loading see section "Anchor Design".

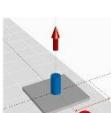

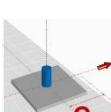

Precalculated values

Recommended loads can be calculated by dividing the design resistance by an overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

a) All data given in this section according ETA-07/0260, issue 2013-06-26.

Basic loading data (for a single anchor)

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Steel failure
- Base material thickness, as specified in the table
- One typical embedment depth, as specified in the table
- One anchor material, as specified in the tables
- Concrete C 20/25, $f_{ck,cube} = 25 \text{ N/mm}^2$
- Temperate range I
(min. base material temperature -40°C, max. long term/short term base material temperature: +24°C/40°C)
- Installation temperature range +5°C to +40°C

For details see Simplified design method

Embedment depth ^{a)} and base material thickness for the basic loading data.

Mean ultimate resistance, characteristic resistance, design resistance, recommended loads.

Anchor size	Data according ETA-07/0260, issue 2013-06-26								
	Ø8	Ø10	Ø12	Ø14	Ø16	Ø20	Ø25	Ø28	Ø32
Typical embedment depth [mm]	80	90	110	125	125	170	210	270	300
Base material thickness [mm]	110	120	145	165	165	220	275	340	380

a) The allowed range of embedment depth is shown in the setting details. The corresponding load values can be calculated according to the simplified design method.

a) With overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Service temperature range

Hilti HIT-RE 500-SD injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

Temperature range	Base material temperature	Maximum long term base material temperature	Maximum short term base material temperature
Temperature range I	-40 °C to +40 °C	+24 °C	+40 °C
Temperature range II	-40 °C to +58 °C	+35 °C	+58 °C
Temperature range III	-40 °C to +70 °C	+43 °C	+70 °C

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

Setting

installation equipment

Anchor size	Ø8	Ø10	Ø12	Ø14	Ø16	Ø20	Ø25	Ø28	Ø32
Rotary hammer				TE 2 – TE 16					TE 40 – TE 70
Other tools	compressed air gun or blow out pump, set of cleaning brushes, dispenser								

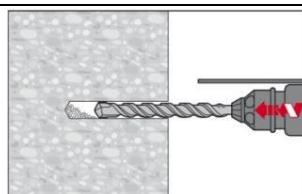

Setting instruction

Bore hole drilling

Drill hole to the required embedment depth with an appropriately sized Hilti TE-CD or TE-YD hollow drill bit with Hilti vacuum attachment. This drilling system removes the dust and cleans the borehole during drilling when using in accordance with the user's manual.

After drilling is complete, proceed to the "injection preparation" step in the instructions for use.

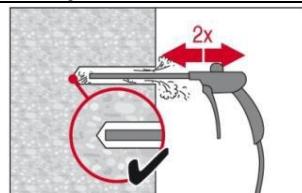

Drill Hole to the required embedment depth with a hammer drill set in rotation-hammer mode using an appropriately sized carbide drill bit.

Bore hole cleaning

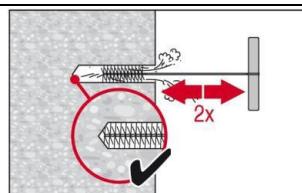

Just before setting an anchor, the bore hole must be free of dust and debris.

Compressed air cleaning (CAC) for all bore hole diameters d_0 and all bore hole depth h_0

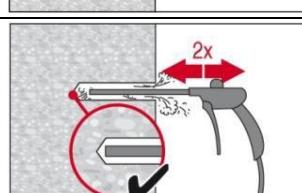

Blow 2 times from the back of the hole (if needed with nozzle extension) over the hole length with oil-free compressed air (min. 6 bar at 6 m³/h) until return air stream is free of noticeable dust.

Bore hole diameter ≥ 32 mm the compressor must supply a minimum air flow of 140 m³/hour.

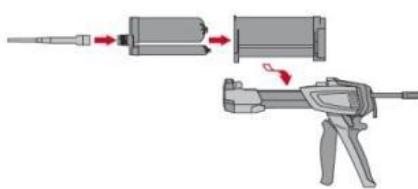

Brush 2 times with the specified brush size by inserting the steel brush Hilti HIT-RB to the back of the hole (if needed with extension) in a twisting motion and removing it.

The brush must produce natural resistance as it enters the bore hole -- if not the brush is too small and must be replaced with the proper brush diameter.

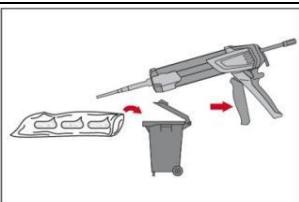

Blow again with compressed air 2 times until return air stream is free of noticeable dust.

Injection preparation

Tightly attach new Hilti mixing nozzle HIT-RE-M to foil pack manifold (snug fit). Do not modify the mixing nozzle.

Observe the instruction for use of the dispenser and the mortar. Check foil pack holder for proper function. Do not use damaged foil packs / holders. Insert foil pack into foil pack holder and put holder into HIT-dispenser.

The foil pack opens automatically as dispensing is initiated. Discard initial adhesive. Depending on the size of the foil pack an initial amount of adhesive has to be discarded.

Discard quantities are:

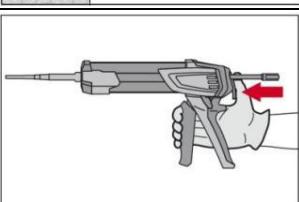

- 3 strokes for 330 ml foil pack,
- 4 strokes for 500 ml foil pack,
- 65 ml for 1400 ml foil pack $\leq 5^{\circ}\text{C}$.

Inject adhesive from the back of the borehole without forming air voids

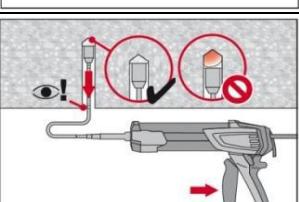

Inject the adhesive starting at the back of the hole, slowly withdrawing the mixer with each trigger pull.

Fill holes approximately 2/3 full It is required that the annular gap between the anchor and the concrete is completely filled with adhesive along the embedment length.

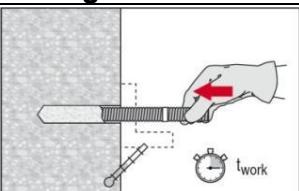

After injection is completed, depressurize the dispenser by pressing the release trigger. This will prevent further adhesive discharge from the mixer.

Overhead installation and/or installation with embedment depth $h_{\text{ef}} > 250\text{mm}$.

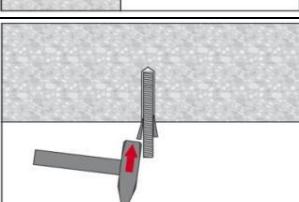

For overhead installation the injection is only possible with the aid of extensions and piston plugs. Assemble HIT-RE-M mixer, extension(s) and appropriately sized piston plug (HIT-SZ). Insert piston plug to back of the hole and inject adhesive. During injection the piston plug will be naturally extruded out of the bore hole by the adhesive pressure.

Setting the element

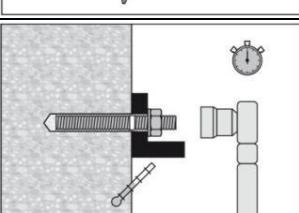

Before use, verify that the element is dry and free of oil and other contaminants.

Mark and set element to the required embedment depth until working time t_{work} has elapsed.

For overhead installation use piston plugs and fix embedded parts with e.g. wedges HIT-OHW.

Loading the anchor:

After required curing time t_{cure} the anchor can be loaded.

The applied installation torque shall not exceed given T_{max} .

For detailed information on installation see instruction for use given with the package of the product.

Curing time for general conditions

Data according ETA-07/0260, issue 2013-06-26		
Temperature of the base material	Working time in which anchor can be inserted and adjusted t_{gel}	Curing time before anchor can be fully loaded t_{cure}
40 °C	12 min	4 h
30 °C to 39 °C	12 min	8 h
20 °C to 29 °C	20 min	12 h
15 °C to 19 °C	30 min	24 h
10 °C to 14 °C	90 min	48 h
5 °C to 9 °C	120 min	72 h

Setting details

Data according ETA-07/0260, issue 2013-06-26												
Anchor size	$\varnothing 8$	$\varnothing 10$	$\varnothing 12$	$\varnothing 14$	$\varnothing 16$	$\varnothing 20$	$\varnothing 25$	$\varnothing 28$	$\varnothing 32$			
Nominal diameter of drill bit d_0 [mm]	12	14	16	18	20	25	32	35	40			
Effective anchorage and drill hole depth range a)	$h_{ef,min}$ [mm]	60	60	70	75	80	90	100	112			
	$h_{ef,max}$ [mm]	160	200	240	280	320	400	500	640			
Minimum base material thickness h_{min} [mm]	$h_{ef} + 30 \text{ mm}$ $\geq 100 \text{ mm}$		$h_{ef} + 2 d_0$									
Minimum spacing s_{min} [mm]	40	50	60	70	80	100	125	140	160			
Minimum edge distance c_{min} [mm]	40	50	60	70	80	100	125	140	160			
Critical spacing for splitting failure $s_{cr,sp}$	$2 c_{cr,sp}$											
Critical edge distance for splitting failure b) c _{cr,sp} [mm]	$1,0 \cdot h_{ef}$ for $h / h_{ef} \geq 2,0$											
	$4,6 h_{ef} - 1,8 h$ for $2,0 > h / h_{ef} > 1,3$											
	$2,26 h_{ef}$ for $h / h_{ef} \leq 1,3$											
Critical spacing for concrete cone failure $s_{cr,N}$	$2 c_{cr,N}$											
Critical edge distance for concrete cone failure c) c _{cr,N}	$1,5 h_{ef}$											

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced.

- a) $h_{ef,min} \leq h_{ef} \leq h_{ef,max}$ (h_{ef} : embedment depth)
- b) h : base material thickness ($h \geq h_{min}$)
- c) The critical edge distance for concrete cone failure depends on the embedment depth h_{ef} and the design bond resistance. The simplified formula given in this table is on the save side.

Simplified design method

Simplified version of the design method according ETAG 001, TR 029. Design resistance according data given in ETA-07/0260, issue 2009-01-12.

- Influence of concrete strength
- Influence of edge distance
- Influence of spacing
- Valid for a group of two anchors. (The method may also be applied for anchor groups with more than two anchors or more than one edge distance. The influencing factors must then be considered for each edge distance and spacing. The calculated design loads are then on the same side: They will be lower than the exact values according ETAG 001, TR 029. To avoid this, it is recommended to use the anchor design software PROFIS anchor)

The design method is based on the following simplification:

- No different loads are acting on individual anchors (no eccentricity)

The values are valid for one anchor.

For more complex fastening applications please use the anchor design software PROFIS Anchor.

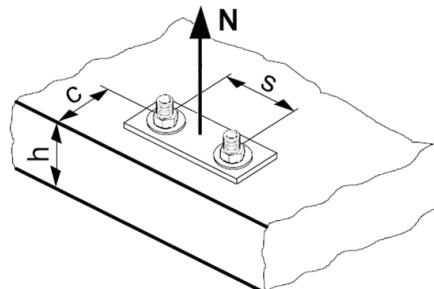

Tension loading

The design tensile resistance is the lower value of

- Steel resistance: $N_{Rd,s}$
- Combined pull-out and concrete cone resistance:

$$N_{Rd,p} = N_{Rd,c}^0 \cdot f_{B,p} \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,p} \cdot f_{re,N}$$
- Concrete cone resistance: $N_{Rd,c} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,N} \cdot f_{re,N}$
- Concrete splitting resistance (only non-cracked concrete):

$$N_{Rd,sp} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,N} \cdot f_{re,N}$$

Basic design tensile resistance

Influencing factors
Influence of concrete strength on combined pull-out and concrete cone resistance

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_{B,p} = (f_{ck,cube}/25N/mm^2)^{0,1}$ a)	1	1,02	1,04	1,06	1,07	1,08	1,09

 a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of embedment depth on combined pull-out and concrete cone resistance

$$f_{h,p} = h_{ef}/h_{ef,typ}$$

Influence of concrete strength on concrete cone resistance

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25N/mm^2)^{1/2}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

 a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of edge distance ^{a)}

$c/c_{cr,N}$	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$c/c_{cr,sp}$										
$f_{1,N} = 0,7 + 0,3 \cdot c/c_{cr,N}$	0,73	0,76	0,79	0,82	0,85	0,88	0,91	0,94	0,97	1
$f_{1,sp} = 0,7 + 0,3 \cdot c/c_{cr,sp}$										
$f_{2,N} = 0,5 \cdot (1 + c/c_{cr,N})$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{2,sp} = 0,5 \cdot (1 + c/c_{cr,sp})$										

- a) The the edge distance shall not be smaller than the minimum edge distance c_{min} given in the table with the setting details. These influencing factors must be considered for every edge distance smaller than the critical edge distance.

Influence of anchor spacing ^{a)}

$s/s_{cr,N}$	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$s/s_{cr,sp}$										
$f_{3,N} = 0,5 \cdot (1 + s/s_{cr,N})$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{3,sp} = 0,5 \cdot (1 + s/s_{cr,sp})$										

- a) The anchor spacing shall not be smaller than the minimum anchor spacing s_{min} given in the table with the setting details. This influencing factor must be considered for every anchor spacing.

Influence of embedment depth on concrete cone resistance

$$f_{h,N} = (h_{ef}/h_{ef,typ})^{1,5}$$

Influence of reinforcement

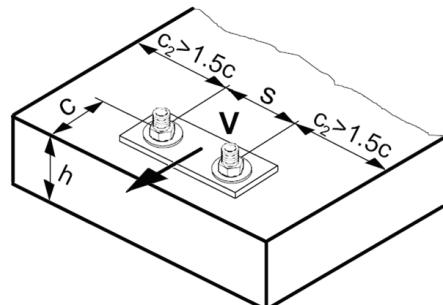

h_{ef} [mm]	40	50	60	70	80	90	≥ 100
$f_{re,N} = 0,5 + h_{ef}/200\text{mm} \leq 1$	0,7 ^{a)}	0,75 ^{a)}	0,8 ^{a)}	0,85 ^{a)}	0,9 ^{a)}	0,95 ^{a)}	1

- a) This factor applies only for dense reinforcement. If in the area of anchorage there is reinforcement with a spacing ≥ 150 mm (any diameter) or with a diameter ≤ 10 mm and a spacing ≥ 100 mm, then a factor $f_{re} = 1$ may be applied.

Shear loading

The design shear resistance is the lower value of

- Steel resistance: $V_{Rd,s}$
- Concrete prout resistance: $V_{Rd,cp} = k \cdot \text{lower value of } N_{Rd,p} \text{ and } N_{Rd,c}$
- Concrete edge resistance: $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_\beta \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Basic design shear resistance

Design steel resistance $V_{Rd,s}$

		Data according ETA-07/0260, issue 2013-06-26

a) The edge distance shall not be smaller than the minimum edge distance c_{min} .

Combined tension and shear loading

For combined tension and shear loading see section "Anchor Design".

Precalculated values

Recommended loads can be calculated by dividing the design resistance by an overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Basic loading data (for a single anchor)

All data in this section is Hilti technical data and applies to

For details see Simplified design method

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Steel failure
- Concrete C 20/25, $f_{ck,cube} = 25 \text{ N/mm}^2$
- min. in service base material temperature -40°C, max. long term/short term base material temperature: +24°C/40°C
- Installation temperature range +5°C to +40°C

c) With overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Materials

Mechanical properties of HIT-CS-F

Anchor size	M12x110	M16x125	M20x170
Nominal tensile strength f_{uk} [N/mm ²]	800	800	800
Yield strength f_{yk} [N/mm ²]	640	640	640
Stressed cross-section of the thread for shear A_s [mm ²]	84,3	157	245
relevant cross-section for tensile loading $A_{s,c}$ [mm ²]	81,7	157	237,8
Moment of resistance W [mm ³]	109	277	541
Char. bending resistance $M_{Rk,s}^0$ with 8.8 Steel Grade [Nm]	105	266	519

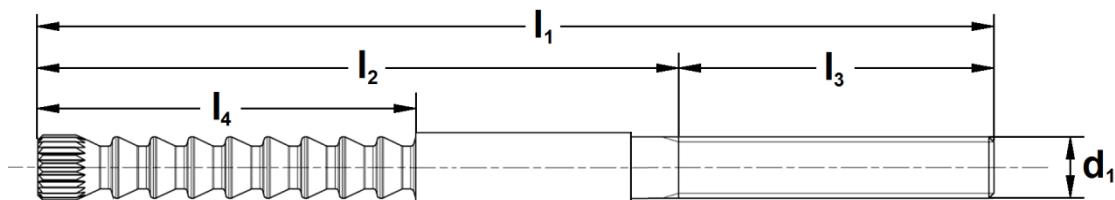

Material quality

Part	Material	
	HIT-CS-F	HIT-CS
Anchor Body	Carbon steel; hot dip galvanized to min. 55 µm, coated	Carbon steel; electrogalvanized to min. 5 µm, coated
Washer	DIN 934-class 8-AZ (according to DIN ISO 965-5); hot dip galvanized to min. 55 µm	Property class 8 acc.to DIN EN ISO 898-2, electrogalvanized to min. 5 µm
Nut	Carbon steel; hot dip galvanized to min. 55 µm	DIN 125-1-size-140HV, electrogalvanized to min. 5 µm

Anchor dimensions of HIT-CS-F

Anchor size	M12x110	M16x125	M20x170
Norminal diameter d_1 [mm]	12	16	20
Length of anchor l_1 [mm]	160 to 660	190 to 675	240 to 720
Embedment depth $l_2 = h_{\text{nom}}$ [mm]	110	125	170
Length of thread l_3 [mm]	50 to 550	65 to 550	70 to 550
Length of helix l_4 [mm]	60	80	110

Anchor rod

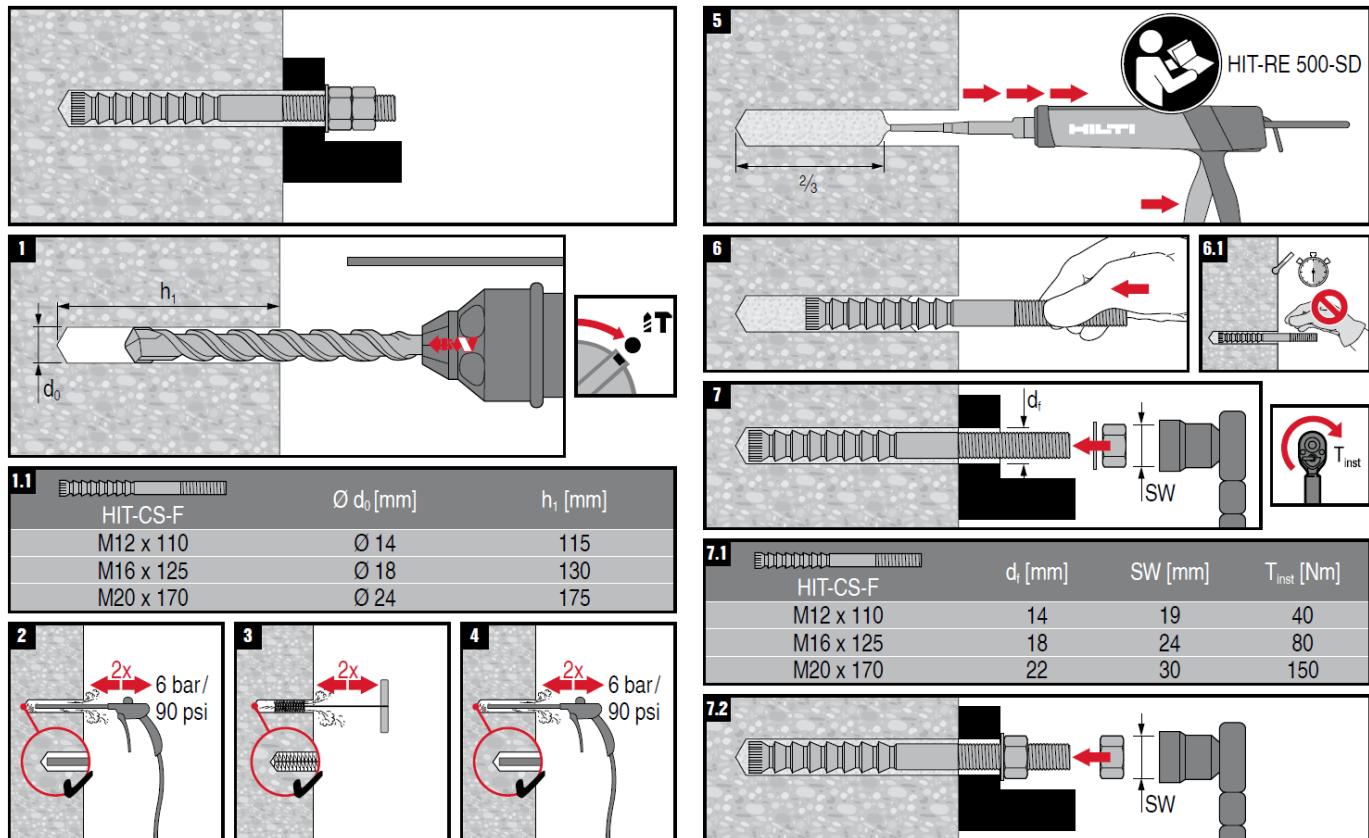

Setting

Installation equipment

Anchor size	M12x110	M16x125	M20x170
Rotary hammer	TE 16 – TE 80		
Other tools	Compressed air gun, set of brushes, dispenser		

Setting instruction

For detailed information on installation see instruction for use given with the package of the product.

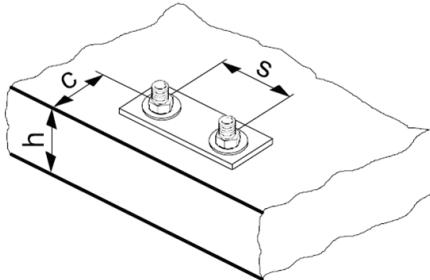

Curing time for general conditions

Temperature of the base material	Working time in which anchor can be inserted and adjusted t_{gel}	Curing time before anchor can be fully loaded t_{cure}
40 °C	12 min	4 h
30 °C to 39 °C	12 min	8 h
20 °C to 29 °C	20 min	12 h
15 °C to 19 °C	30 min	24 h
10 °C to 14 °C	90 min	48 h
5 °C to 9 °C	120 min	72 h

Setting details

Anchor size	M12x110		M16x125		M20x170	
Anchor type	HIT-CS-F	HIT-CS	HIT-CS-F	HIT-CS	HIT-CS-F	HIT-CS
Nominal diameter of drill bit d_0 [mm]	14		18		22	
Cutting diameter of drill bit $d_{cut} \leq$ [mm]	14,5		18,5		22,5	
Effective anchorage depth h_{ef} [mm]	102		117		158	
Nominal anchorage depth h_{nom} [mm]	110		125		170	
Depth of drill hole $h_1 \geq$ [mm]	115		130		175	
Minimum base material thickness $h_{min}^a)$ [mm]	140		170	200	230	250
Diameter of clearance hole in the fixture $d_f \leq$ [mm]	14		18		22	
Minimum spacing and minimum edge distance	s_{min} [mm]	60	90	80	100	100
	c_{min} [mm]	60	90	80	100	120
Critical edge distance for splitting failure	$s_{cr,sp}$ [mm]	7 hef		7 hef		7 hef
	$c_{cr,sp}$ [mm]	3,5 hef		3,5 hef		3,5 hef
Critical edge distance for concrete cone failure	$s_{cr,N}$ [mm]	330		375		510
	$c_{cr,N}$ [mm]	165		187,5		255
Max. torque moment	T_{inst} [Nm]	40		80		150

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced.

- a) h: base material thickness ($h \geq h_{min}$)

Simplified design method

Simplified version of the design method according ETAG 001, Annex C.

- Influence of concrete strength
- Influence of edge distance
- Influence of spacing
- Valid for a group of two anchors. The method may also be applied for anchor groups with more than two anchors or more than one edge distance. The influencing factors must then be considered for each edge distance and spacing.

The design method is based on the following simplification:

- No different loads are acting on individual anchors (no eccentricity)

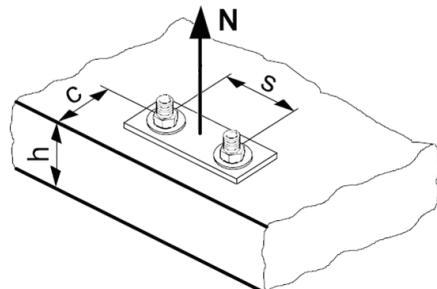

The values are valid for one anchor.

Tension loading

The design tensile resistance is the lower value of

- Steel resistance: $N_{Rd,s}$
- Pull-out resistance: $N_{Rd,p} = N_{Rd,p}^0 \cdot f_B$
- Concrete cone resistance: $N_{Rd,c} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N}$
- Concrete splitting resistance (only non-cracked concrete):

$$N_{Rd,sp} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,sp}$$

Basic design tensile resistance

Design steel resistance $N_{Rd,s}$

Anchor size	M12	M16	M20
$N_{Rd,s}$ [kN]	43,6	98,1	126,8

Design pull-out a resistance $N_{Rd,p} = N_{Rd,p}^0$

Anchor size	Non-cracked concrete			Cracked concrete		
	M12	M16	M20	M12	M16	M20
Embedment depth h_{ef} [mm]	110	125	170	110	125	170
$N_{Rd,p}^0$ [kN]	No pull-out failure					

Design concrete cone resistance $N_{Rd,c} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N}$

Design splitting resistance $N_{Rd,sp} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp}$

Anchor size	Non-cracked concrete			Cracked concrete		
	M12	M16	M20	M12	M16	M20
$N_{Rd,c}^0$ [kN]	32,4	39,2	62,2	23,1	28,0	44,3

Influencing factors

Influence of concrete strength on concrete cone resistance

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25\text{N/mm}^2)^{0,5}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of edge distance ^{a)}

c/c _{cr,N}	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
c/c _{cr,sp}										
f _{1,N} = 0,7 + 0,3·c/c _{cr,N}	0,73	0,76	0,79	0,82	0,85	0,88	0,91	0,94	0,97	1
f _{1,sp} = 0,7 + 0,3·c/c _{cr,sp}										
f _{2,N} = 0,5·(1 + c/c _{cr,N})	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
f _{2,sp} = 0,5·(1 + c/c _{cr,sp})										

- a) The the edge distance shall not be smaller than the minimum edge distance c_{min} given in the table with the setting details. These influencing factors must be considered for every edge distance smaller than the critical edge distance.

Influence of anchor spacing ^{a)}

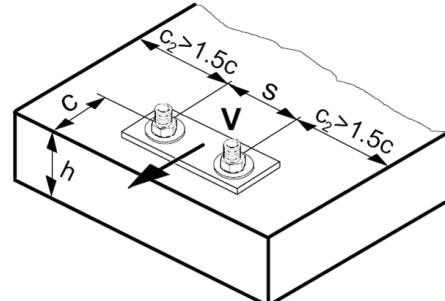

s/s _{cr,N}	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
s/s _{cr,sp}										
f _{3,N} = 0,5·(1 + s/s _{cr,N})	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
f _{3,sp} = 0,5·(1 + s/s _{cr,sp})										

- a) The anchor spacing shall not be smaller than the minimum anchor spacing s_{min} given in the table with the setting details. This influencing factor must be considered for every anchor spacing.

Shear loading

The design shear resistance is the lower value of

- Steel resistance: $V_{Rd,s}$
- Concrete prout resistance: $V_{Rd,cp} = k \cdot \text{lower value of } N_{Rd,p} \text{ and } N_{Rd,c}$
- Concrete edge resistance: $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_\beta \cdot f_h \cdot f_4$

Basic design shear resistance

Design steel resistance $V_{Rd,s}$

Anchor size	M12	M16	M20
$V_{Rd,s}$ HIT-CS-F [kN]	27,0	50,2	78,4

Design concrete prout resistance $V_{Rd,cp} = k \cdot N_{Rd,c}$

$$k = 2$$

Design concrete edge resistance ^{a)} $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_\beta \cdot f_h \cdot f_4$

Anchor size	Non-cracked concrete			Cracked concrete		
	M12	M16	M20	M12	M16	M20
$V_{Rd,c}^0$ [kN]	11,6	18,7	27,0	8,2	13,2	19,2

- a) For anchor groups only the anchors close to the edge must be considered.

Influencing factors

Influence of concrete strength

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25N/mm^2)^{1/2}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of angle between load applied and the direction perpendicular to the free edge

Angle β	0°	10°	20°	30°	40°	50°	60°	70°	80°	≥ 90°
$f_\beta = \sqrt{\frac{1}{(\cos \alpha_v)^2 + \left(\frac{\sin \alpha_v}{2,5}\right)^2}}$	1	1,01	1,05	1,13	1,24	1,40	1,64	1,97	2,32	2,50

Influence of base material thickness

h/c	0,15	0,3	0,45	0,6	0,75	0,9	1,05	1,2	1,35	≥ 1,5
$f_h = \{h/(1,5 \cdot c)\}^{2/3} \leq 1$	0,22	0,34	0,45	0,54	0,63	0,71	0,79	0,86	0,93	1,00

Influence of anchor spacing and edge distance a) for concrete edge resistance: f_4

$$f_4 = (c/h_{ef})^{1,5} \cdot (1 + s / [3 \cdot c]) \cdot 0,5$$

c/h _{ef}	Single anchor	Group of two anchors s/h _{ef}

a) The anchor spacing and the edge distance shall not be smaller than the minimum anchor spacing s_{min} and the minimum edge distance c_{min} .

Combined tension and shear loading

The following equations must be satisfied

$$\beta_N \leq 1$$

$$\beta_V \leq 1$$

$$\beta_N + \beta_V \leq 1,2 \text{ or } \beta_N^\alpha + \beta_V^\alpha \leq 1$$

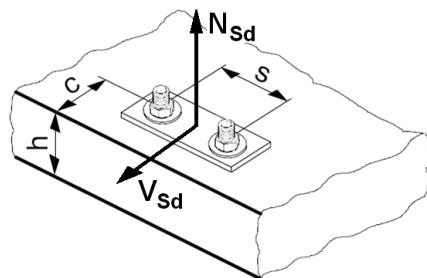

With

$$\beta_N = N_{Sd} / N_{Rd} \text{ and}$$

$$\beta_V = V_{Sd} / V_{Rd}$$

$N_{Sd} (V_{Sd})$ = tension (shear)
design action

$N_{Rd} (V_{Rd})$ = tension (shear)
design resistance

Annex C of ETAG 001

$\alpha = 2,0$ if N_{Rd} and V_{Rd} are governed by steel failure

$\alpha = 1,5$ for all other failure modes

Simplified design method

Failure mode is not considered for the simplified method

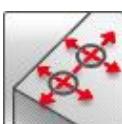

$\alpha = 1,5$ for all failure modes (leading to conservative results)

a) All data given in this section according ETA-04/0027, issue 2013-06-26.

Basic loading data (for a single anchor)

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Steel failure
- Base material thickness, as specified in the table
- One typical embedment depth, as specified in the table
- One anchor material, as specified in the tables
- Concrete C 20/25, $f_{ck,cube} = 25 \text{ N/mm}^2$
- Temperature range I
(min. base material temperature -40°C, max. long term/short term base material temperature: +24°C/40°C)
- Installation temperature range +5°C to +40°C

For details see Simplified design method

Embedment depth ^{a)} and base material thickness for the basic loading data.

Mean ultimate resistance, characteristic resistance, design resistance, recommended loads.

Anchor size	M8	M10	M12	M16	M20	M24	M27	M30	M33	M36	M39
Typical embedment depth [mm]	80	90	110	125	170	210	240	270	300	330	360
Base material thickness [mm]	110	120	140	165	220	270	300	340	380	410	450

a) The allowed range of embedment depth is shown in the setting details. The corresponding load values can be calculated according to the simplified design method.

For hammer drilled holes and hollow drill bit:

Mean ultimate resistance: concrete C 20/25 – $f_{ck,cube} = 25 \text{ N/mm}^2$, anchor HIT-V 5.8

Service temperature range

Hilti HIT-RE 500 injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

Temperature range	Base material temperature	Maximum long term base material temperature	Maximum short term base material temperature
Temperature range I	-40 °C to +40 °C	+24 °C	+40 °C
Temperature range II	-40 °C to +58 °C	+35 °C	+58 °C
Temperature range III	-40 °C to +70 °C	+43 °C	+70 °C

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

- a) For anchors in diamond drilled holes load values for combined pull-out and concrete cone resistance have to be reduced (see section "Setting instruction")

Setting instruction

Bore hole drilling

a) Hilti hollow drill bit

(for dry and wet concrete only)

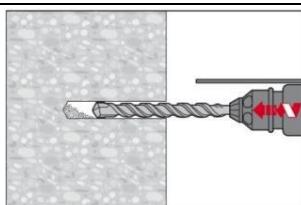

Drill hole to the required embedment depth with an appropriately sized Hilti TE-CD or TE-YD hollow drill bit with Hilti vacuum attachment. This drilling system removes the dust and cleans the bore hole during drilling when used in accordance with the user's manual.

After drilling is complete, proceed to the "injection preparation" step in the instructions for use.

b) Hammer drilling

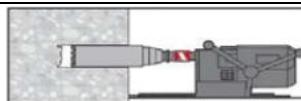

(dry or wet concrete and installation in flooded holes (no sea water))

Drill Hole to the required embedment depth with a hammer drill set in rotation-hammer mode using an appropriately sized carbide drill bit.

c) Diamond coring

(for dry and wet concrete only)

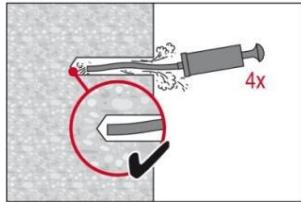

Diamond coring is permissible when diamond core drilling machine and the corresponding core bit are used.

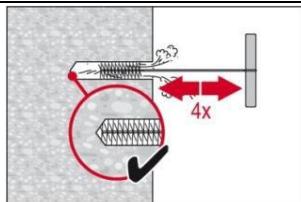

Bore hole cleaning

 Just before setting an anchor, the bore hole must be free of dust and debris.

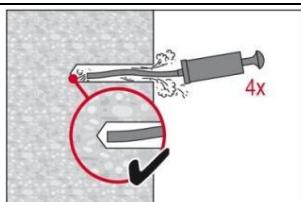

a) Manual Cleaning (MC) non-cracked concrete only

for bore hole diameters $d_0 \leq 20\text{mm}$ and bore hole depth $h_0 \leq 20d$ or $h_0 \leq 250\text{ mm}$ (d = diameter of element)

The Hilti manual pump may be used for blowing out bore holes up to diameters $d_0 \leq 20\text{ mm}$ and embedment depths up to $h_{ef} \leq 10d$. Blow out at least 4 times from the back of the bore hole until return air stream is free of noticeable dust

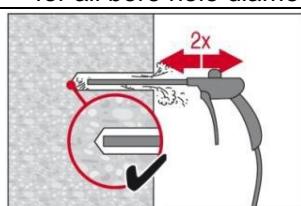

Brush 4 times with the specified brush size (brush diameter \geq bore hole) by inserting the steel brush Hilti HIT-RB to the back of the hole (if needed with extension) in a twisting motion and removing it. The brush must produce natural resistance as it enters the bore hole - if not the brush is too small and must be replaced with the proper brush diameter.

Blow out again with manual pump at least 4 times until return air stream is free of noticeable dust.

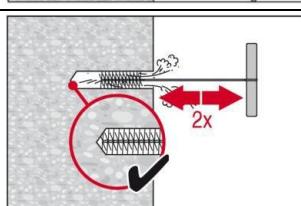

b) Compressed air cleaning (CAC)

for all bore hole diameters d_0 and all bore hole depth h_0

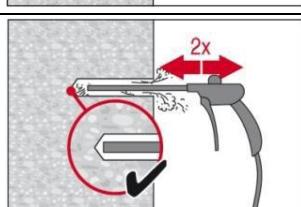

Blow 2 times from the back of the hole (if needed with nozzle extension) over the hole length with oil-free compressed air (min. 6 bar at 6 m³/h) until return air stream is free of noticeable dust.

Bore hole diameter ≥ 32 mm the compressor must supply a minimum air flow of 140 m³/hour.

Brush 2 times with the specified brush size by inserting the steel brush Hilti HIT-RB to the back of the hole (if needed with extension) in a twisting motion and removing it.

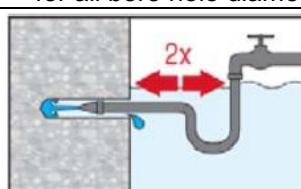

The brush must produce natural resistance as it enters the bore hole - if not the brush is too small and must be replaced with the proper brush diameter.

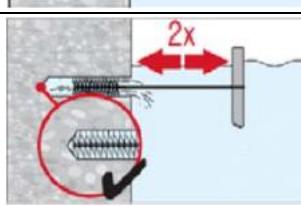

Blow again with compressed air 2 times until return air stream is free of noticeable dust.

c) Cleaning for under water

for all bore hole diameters d_0 and all bore hole depth h_0

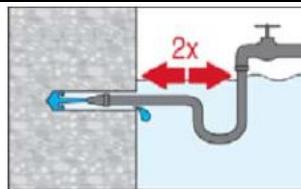

Flush 2 times the hole by inserting a water hose (water-line pressure) to the back of the hole until water runs clear.

Brush 2 times with the specified brush size by inserting the steel brush Hilti HIT-RB to the back of the hole (if needed with extension) in a twisting motion and removing it.

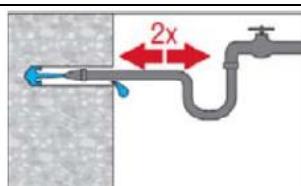

The brush must produce natural resistance as it enters the bore hole - if not the brush is too small and must be replaced with the proper brush diameter.

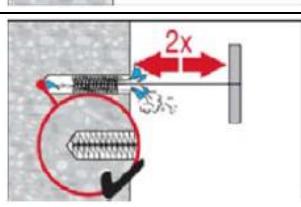

Flush again 2 times the hole by inserting a water hose (water-line pressure) to the back of the hole until water runs clear.

d) Cleaning of hammer drilled holes and diamond cored holes

for all bore hole diameters d_0 and all bore hole depth h_0

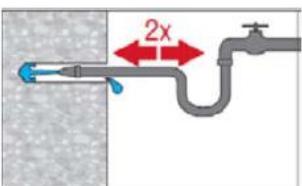

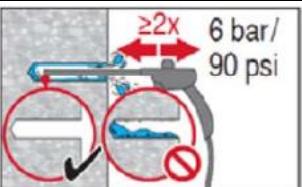

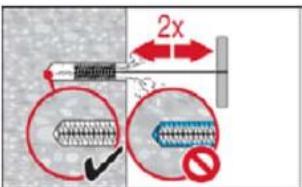

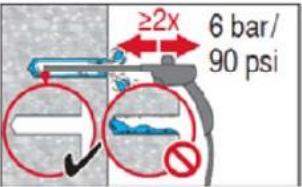

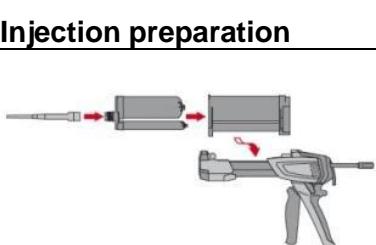

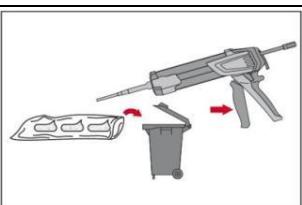

Flush 2 times the hole by inserting a water hose (water-line pressure) to the back of the hole until water runs clear.

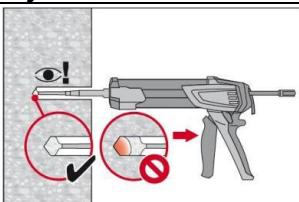

Brush 2 times with the specified brush size by inserting the steel brush Hilti HIT-RB to the back of the hole (if needed with extension) in a twisting motion and removing it.

The brush must produce natural resistance as it enters the bore hole - if not the brush is too small and must be replaced with the proper brush diameter.

	Flush again 2 times the hole by inserting a water hose (water-line pressure) to the back of the hole until water runs clear.
	Blow 2 times from the back of the hole (if needed with nozzle extension) over the hole length with oil-free compressed air (min. 6 bar at 6 m³/h) until return air stream is free of noticeable dust and water. Bore hole diameter ≥ 32 mm the compressor must supply a minimum air flow of 140 m³/hour.
	Brush 2 times with the specified brush size by inserting the steel brush Hilti HIT-RB to the back of the hole (if needed with extension) in a twisting motion and removing it. The brush must produce natural resistance as it enters the bore hole - if not the brush is too small and must be replaced with the proper brush diameter.
	Blow again with compressed air 2 times until return air stream is free of noticeable dust and water.
Injection preparation	
	Tightly attach new Hilti mixing nozzle HIT-RE-M to foil pack manifold (snug fit). Do not modify the mixing nozzle. Observe the instruction for use of the dispenser and mortar. Check foil pack holder for proper function. Do not use damaged foil packs / holders. Insert foil pack into foil pack holder and put holder into HIT-dispenser.
	The foil pack opens automatically as dispensing is initiated. Discard initial adhesive. Depending on the size of the foil pack an initial amount of adhesive has to be discarded. Discard quantities are: 2 strokes for 330 ml foil pack, 3 strokes for 500 ml foil pack, 65 ml for 1400 ml foil pack.

Inject adhesive from the back of the borehole without forming air voids

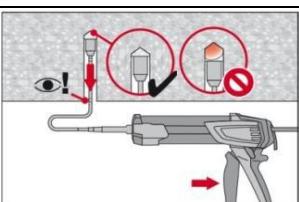

Inject the adhesive starting at the back of the hole, slowly withdrawing the mixer with each trigger pull.

Fill holes approximately 2/3 full. It is required that the annular gap between the anchor and the concrete is completely filled with adhesive along the embedment length.

After injection is completed, depressurize the dispenser by pressing the release trigger. This will prevent further adhesive discharge from the mixer.

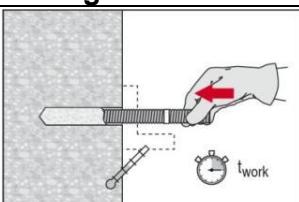

Overhead installation and/or installation with embedment depth $h_{ef} > 250\text{mm}$.

For overhead installation the injection is only possible with the aid of extensions and piston plugs. Assemble HIT-RE-M mixer, extension(s) and appropriately sized piston plug HIT-SZ. Insert piston plug to back of the hole and inject adhesive. During injection the piston plug will be naturally extruded out of the bore hole by the adhesive pressure.

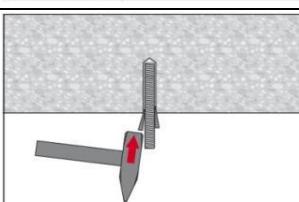

Under water application: fill borehole completely with mortar.

Setting the element

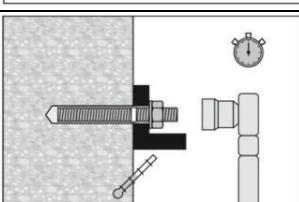

Before use, verify that the element is dry and free of oil and other contaminants.

Mark and set element to the required embedment depth until working time t_{work} has elapsed.

For overhead installation use piston plugs and fix embedded parts with e.g. wedges HIT-OHW.

Loading the anchor:

After required curing time t_{cure} the anchor can be loaded.

The applied installation torque shall not exceed T_{max} .

For detailed information on installation see instruction for use given with the package of the product.

Curing time for general conditions

Data according ETA-04/0027, issue 2013-06-26		
Temperature of the base material	Working time in which anchor can be inserted and adjusted t_{gel}	Curing time before anchor can be fully loaded t_{cure}
40 °C	12 min	4 h
30 °C to 39 °C	12 min	8 h
20 °C to 29 °C	20 min	12 h
15 °C to 19 °C	30 min	24 h
10 °C to 14 °C	90 min	48 h
5 °C to 9 °C	120 min	72 h

For dry concrete curing times may be reduced according to the following table.

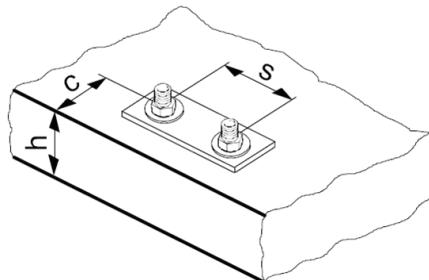

For installation temperatures below +5 °C all load values have to be reduced according to the load reduction factors given below.

Curing time for dry concrete

Additional Hilti technical data			
Temperature of the base material	Working time in which anchor can be inserted and adjusted t_{gel}	Reduced curing time before anchor can be fully loaded $t_{cure,dry}$	Load reduction factor
40 °C	12 min	4 h	1
30 °C	12 min	8 h	1
20 °C	20 min	12 h	1
15 °C	30 min	18 h	1
10 °C	90 min	24 h	1
5 °C	120 min	36 h	1
0 °C	3 h	50 h	0,7
-5 °C	4 h	72 h	0,6

Setting details

		Data according ETA-04/0027, issue 2013-06-26								Additional Hilti technical data		
Anchor size		M8	M10	M12	M16	M20	M24	M27	M30	M33	M36	M39
Nominal diameter of drill bit	d_0 [mm]	10	12	14	18	24	28	30	35	37	40	42
Effective anchorage and drill hole depth range ^{a)}	$h_{ef,min}$ [mm]	40	40	48	64	80	96	108	120	132	144	156
	$h_{ef,max}$ [mm]	160	200	240	320	400	480	540	600	660	720	780
Minimum base material thickness	h_{min} [mm]	$h_{ef} + 30 \text{ mm}$ $\geq 100 \text{ mm}$			$h_{ef} + 2 d_0$							
Diameter of clearance hole in the fixture	d_f [mm]	9	12	14	18	22	26	30	33	36	39	42
Minimum spacing	s_{min} [mm]	40	50	60	80	100	120	135	150	165	180	195
Minimum edge distance	c_{min} [mm]	40	50	60	80	100	120	135	150	165	180	195
Critical spacing for splitting failure	$s_{cr,sp}$	$2 c_{cr,sp}$										
Critical edge distance for splitting failure ^{b)}	$c_{cr,sp}$ [mm]	$1,0 \cdot h_{ef}$ for $h / h_{ef} \geq 2,0$										
		$4,6 h_{ef} - 1,8 h$ for $2,0 > h / h_{ef} > 1,3$										
		$2,26 h_{ef}$ for $h / h_{ef} \leq 1,3$										
Critical spacing for concrete cone failure	$s_{cr,N}$	$2 c_{cr,N}$										
Critical edge distance for concrete cone failure ^{c)}	$c_{cr,N}$	$1,5 h_{ef}$										
Torque moment ^{d)}	T_{max} [Nm]	10	20	40	80	150	200	270	300	330	360	390

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced.

- a) $h_{ef,min} \leq h_{ef} \leq h_{ef,max}$ (h_{ef} : embedment depth)
- b) h : base material thickness ($h \geq h_{min}$)
- c) The critical edge distance for concrete cone failure depends on the embedment depth h_{ef} and the design bond resistance. The simplified formula given in this table is on the save side.
- d) This is the maximum recommended torque moment to avoid splitting failure during installation for anchors with minimum spacing and/or edge distance.

Simplified design method

Simplified version of the design method according ETAG 001, TR 029. Design resistance according data given in ETA-04/0027, issue 2009-05-20.

- Influence of concrete strength
- Influence of edge distance
- Influence of spacing
- Valid for a group of two anchors. (The method may also be applied for anchor groups with more than two anchors or more than one edge distance. The influencing factors must then be considered for each edge distance and spacing. The calculated design loads are then on the same side: They will be lower than the exact values according ETAG 001, TR 029. To avoid this, it is recommended to use the anchor design software PROFIS anchor)

The design method is based on the following simplification:

- No different loads are acting on individual anchors (no eccentricity)

The values are valid for one anchor.

For more complex fastening applications please use the anchor design software PROFIS Anchor.

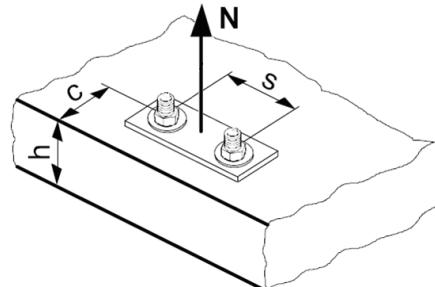

Tension loading

The design tensile resistance is the lower value of

- Steel resistance: $N_{Rd,s}$
- Combined pull-out and concrete cone resistance:

$$N_{Rd,p} = N^0_{Rd,p} \cdot f_{B,p} \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,p} \cdot f_{re,N}$$
- Concrete cone resistance: $N_{Rd,c} = N^0_{Rd,c} \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,N} \cdot f_{re,N}$
- Concrete splitting resistance (only non-cracked concrete):

$$N_{Rd,sp} = N^0_{Rd,c} \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,N} \cdot f_{re,N}$$

Basic design tensile resistance

Design steel resistance $N_{Rd,s}$

The design values for concrete cone and splitting resistance may be increased by 20 % for anchor installation in dry concrete (concrete not in contact with water before/during installation and curing).

Influencing factors

Influence of concrete strength on combined pull-out and concrete cone resistance

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25N/mm^2)^{1/2}$ ^{a)}	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of embedment depth on combined pull-out and concrete cone resistance

$$f_{h,p} = h_{ef}/h_{ef,typ}$$

Influence of concrete strength on concrete cone resistance

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25N/mm^2)^{1/2}$ ^{a)}	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of edge distance ^{a)}

c/c_{cr,N}	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
c/c_{cr,sp}										
$f_{1,N} = 0,7 + 0,3 \cdot c/c_{cr,N}$	0,73	0,76	0,79	0,82	0,85	0,88	0,91	0,94	0,97	1
$f_{1,sp} = 0,7 + 0,3 \cdot c/c_{cr,sp}$										
$f_{2,N} = 0,5 \cdot (1 + c/c_{cr,N})$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{2,sp} = 0,5 \cdot (1 + c/c_{cr,sp})$										

- a) The the edge distance shall not be smaller than the minimum edge distance c_{min} given in the table with the setting details. These influencing factors must be considered for every edge distance smaller than the critical edge distance.

Influence of anchor spacing ^{a)}

s/s_{cr,N}	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
s/s_{cr,sp}										
$f_{3,N} = 0,5 \cdot (1 + s/s_{cr,N})$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{3,sp} = 0,5 \cdot (1 + s/s_{cr,sp})$										

- a) The anchor spacing shall not be smaller than the minimum anchor spacing s_{min} given in the table with the setting details. This influencing factor must be considered for every anchor spacing.

Influence of embedment depth on concrete cone resistance

$$f_{h,N} = (h_{ef}/h_{ef,typ})^{1,5}$$

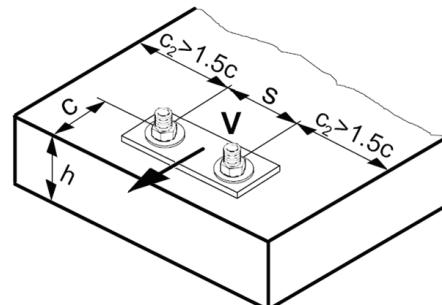

Influence of reinforcement

h_{ef} [mm]	40	50	60	70	80	90	≥ 100
$f_{re,N} = 0,5 + h_{ef}/200\text{mm} \leq 1$	0,7 ^{a)}	0,75 ^{a)}	0,8 ^{a)}	0,85 ^{a)}	0,9 ^{a)}	0,95 ^{a)}	1

- a) This factor applies only for dense reinforcement. If in the area of anchorage there is reinforcement with a spacing ≥ 150 mm (any diameter) or with a diameter ≤ 10 mm and a spacing ≥ 100 mm, then a factor $f_{re} = 1$ may be applied.

Shear loading
The design shear resistance is the lower value of

- Steel resistance: $V_{Rd,s}$
- Concrete prout resistance: $V_{Rd,cp} = k \cdot \text{lower value of } N_{Rd,p} \text{ and } N_{Rd,c}$
- Concrete edge resistance: $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_\beta \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Basic design shear resistance

Design steel resistance $V_{Rd,s}$

Design concrete prout resistance $V_{Rd,cp} = \text{lower value}^a)$ of $k \cdot N_{Rd,p}$ and $k \cdot N_{Rd,c}$

$k = 1$ for $h_{ef} < 60$ mm

$k = 2$ for $h_{ef} \geq 60$ mm

- a) $N_{Rd,p}$: Design combined pull-out and concrete cone resistance
 $N_{Rd,c}$: Design concrete cone resistance

Design concrete edge resistance $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_\beta \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Anchor size	M8	M10	M12	M16	M20	M24	M27	M30	M33	M36	M39
Non-cracked concrete											
$V_{Rd,c}^0$ [kN]	5,9	8,6	11,6	18,7	27,0	36,6	44,5	53,0	62,1	71,7	81,9

Influencing factors

Influence of concrete strength

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25\text{N/mm}^2)^{1/2}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of angle between load applied and the direction perpendicular to the free edge

Angle β	0°	10°	20°	30°	40°	50°	60°	70°	80°	≥ 90°
$f_\beta = \sqrt{\frac{1}{(\cos \alpha_v)^2 + \left(\frac{\sin \alpha_v}{2,5}\right)^2}}$	1	1,01	1,05	1,13	1,24	1,40	1,64	1,97	2,32	2,50

Influence of base material thickness

h/c	0,15	0,3	0,45	0,6	0,75	0,9	1,05	1,2	1,35	≥ 1,5
$f_h = \{h/(1,5 \cdot c)\}^{1/2} \leq 1$	0,32	0,45	0,55	0,63	0,71	0,77	0,84	0,89	0,95	1,00

Influence of anchor spacing and edge distance ^{a)} for concrete edge resistance: f_4
 $f_4 = (c/h_{ef})^{1,5} \cdot (1 + s / [3 \cdot c]) \cdot 0,5$

c/h _{ef}	Single anchor	Group of two anchors s/h _{ef}														
		0,75	1,50	2,25	3,00	3,75	4,50	5,25	6,00	6,75	7,50	8,25	9,00	9,75	10,50	11,25

a) The anchor spacing and the edge distance shall not be smaller than the minimum anchor spacing s_{min} and the minimum edge distance c_{min} .

Influence of embedment depth

h_{ef}/d	4	4,5	5	6	7	8	9	10	11
$f_{hef} = 0,05 \cdot (h_{ef} / d)^{1,68}$	0,51	0,63	0,75	1,01	1,31	1,64	2,00	2,39	2,81
h_{ef}/d	12	13	14	15	16	17	18	19	20
$f_{hef} = 0,05 \cdot (h_{ef} / d)^{1,68}$	3,25	3,72	4,21	4,73	5,27	5,84	6,42	7,04	7,67

Influence of edge distance ^{a)}

c/d	4	6	8	10	15	20	30	40
$f_c = (d / c)^{0,19}$	0,77	0,71	0,67	0,65	0,60	0,57	0,52	0,50

a) The edge distance shall not be smaller than the minimum edge distance c_{min} .

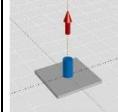

Combined tension and shear loading for hammer drilling or hollow drill bit

For combined tension and shear loading see section "Anchor Design".

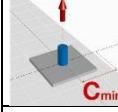

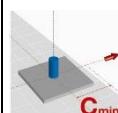

Precalculated values

Recommended loads can be calculated by dividing the design resistance by an overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

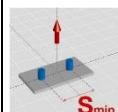

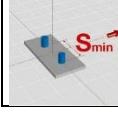

Design resistance: concrete C 20/25 – $f_{ck,cube} = 25 \text{ N/mm}^2$, Temperature range I

a) All data given in this section according ETA-04/0027, issue 2013-06-26.

Basic loading data (for a single anchor)

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Steel failure
- Screw strength class 8.8
- Base material thickness, as specified in the table
- One typical embedment depth, as specified in the table
- One anchor material, as specified in the tables
- Concrete C 20/25, $f_{ck,cube} = 25 \text{ N/mm}^2$
- Temperate range I
(min. base material temperature -40°C, max. long term/short term base material temperature: +24°C/40°C)
- Installation temperature range +5°C to +40°C

For details see Simplified design method

**Embedment depth and base material thickness for the basic loading data.
 Mean ultimate resistance, characteristic resistance, design resistance, recommended loads.**

Anchor size	M8	M10	M12	M16	M20
Embedment depth [mm]	90	110	125	170	205
Base material thickness [mm]	120	150	170	230	270

For hammer drilled holes and hollow drill bit:

Mean ultimate resistance ^{a)}: concrete C 20/25 – $f_{ck,cube} = 25 \text{ N/mm}^2$, anchor HIS-N

		Data according ETA-04/0027, issue 2013-06-26 for hammer drilling and hollow drill bit				
Anchor size		M8	M10	M12	M16	M20
Tensile $N_{Ru,m}$	HIS-N [kN]	26,3	48,3	70,4	123,9	114,5
Shear $V_{Ru,m}$	HIS-N [kN]	13,7	24,2	41,0	62,0	57,8

Characteristic resistance: concrete C 20/25 – $f_{ck,cube} = 25 \text{ N/mm}^2$, anchor HIS-N

Anchor size		M8	M10	M12	M16	M20
Tensile N_{rec}	HIS-N [kN]	11,9	19,8	24,0	38,1	47,6
Shear V_{rec}	HIS-N [kN]	7,4	13,1	18,6	28,1	26,2

a) With overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Service temperature range

Hilti HIT-RE 500 injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

Temperature range	Base material temperature	Maximum long term base material temperature	Maximum short term base material temperature
Temperature range I	-40 °C to +40 °C	+24 °C	+40 °C
Temperature range II	-40 °C to +58 °C	+35 °C	+58 °C
Temperature range III	-40 °C to +70 °C	+43 °C	+70 °C

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

Materials

Additional Hilti recommended tools	DD EC-1, DD 100 ... DD xxx ^{a)}				

a) For anchors in diamond drilled holes load values for combined pull-out and concrete cone resistance have to be reduced (see section "Setting instruction")

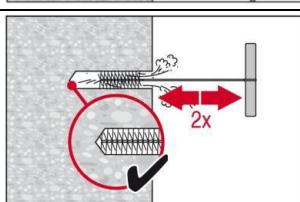

Setting instruction

Bore hole drilling	
a) Hilti hollow drill bit	(for dry and wet concrete only)
	Drill hole to the required embedment depth with an appropriately sized Hilti TE-CD or TE-YD hollow drill bit with Hilti vacuum attachment. This drilling system removes the dust and cleans the bore hole during drilling when used in accordance with the user's manual. After drilling is complete, proceed to the "injection preparation" step in the instructions for use.
b) Hammer drilling	(dry or wet concrete and installation in flooded holes (no sea water))
	Drill Hole to the required embedment depth with a hammer drill set in rotation-hammer mode using an appropriately sized carbide drill bit.
c) Diamond coring	(for dry and wet concrete only)
	Diamond coring is permissible when diamond core drilling machine and the corresponding core bit are used.
Bore hole cleaning Just before setting an anchor, the bore hole must be free of dust and debris.	
a) Manual Cleaning (MC) non-cracked concrete only	for bore hole diameters $d_0 \leq 20\text{mm}$ and bore hole depth $h_0 \leq 20d$ or $h_0 \leq 250\text{ mm}$ (d = diameter of element)
	The Hilti manual pump may be used for blowing out bore holes up to diameters $d_0 \leq 20\text{ mm}$ and embedment depths up to $h_{ef} \leq 10d$. Blow out at least 4 times from the back of the bore hole until return air stream is free of noticeable dust
	Brush 4 times with the specified brush size (brush diameter \geq bore hole) by inserting the steel brush Hilti HIT-RB to the back of the hole (if needed with extension) in a twisting motion and removing it. The brush must produce natural resistance as it enters the bore hole - if not the brush is too small and must be replaced with the proper brush diameter.
	Blow out again with manual pump at least 4 times until return air stream is free of noticeable dust.

b) Compressed air cleaning (CAC)for all bore hole diameters d_0 and all bore hole depth h_0 

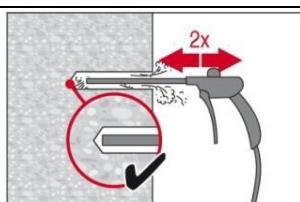

Blow 2 times from the back of the hole (if needed with nozzle extension) over the hole length with oil-free compressed air (min. 6 bar at 6 m³/h) until return air stream is free of noticeable dust.

Bore hole diameter ≥ 32 mm the compressor must supply a minimum air flow of 140 m³/hour.

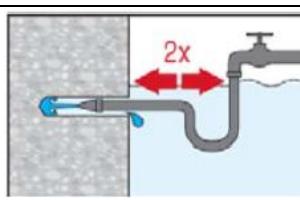

Brush 2 times with the specified brush size by inserting the steel brush Hilti HIT-RB to the back of the hole (if needed with extension) in a twisting motion and removing it.

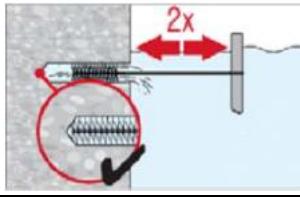

The brush must produce natural resistance as it enters the bore hole - if not the brush is too small and must be replaced with the proper brush diameter.

Blow again with compressed air 2 times until return air stream is free of noticeable dust.

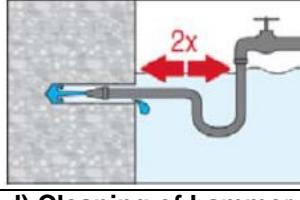

c) Cleaning for under waterfor all bore hole diameters d_0 and all bore hole depth h_0 

Flush 2 times the hole by inserting a water hose (water-line pressure) to the back of the hole until water runs clear.

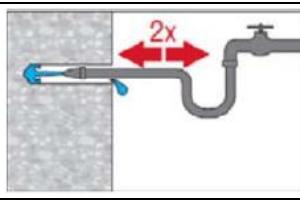

Brush 2 times with the specified brush size by inserting the steel brush Hilti HIT-RB to the back of the hole (if needed with extension) in a twisting motion and removing it.

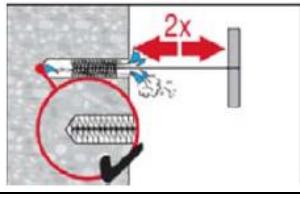

The brush must produce natural resistance as it enters the bore hole - if not the brush is too small and must be replaced with the proper brush diameter.

Flush again 2 times the hole by inserting a water hose (water-line pressure) to the back of the hole until water runs clear.

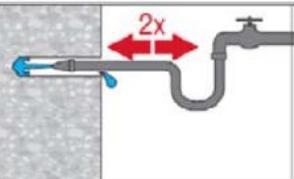

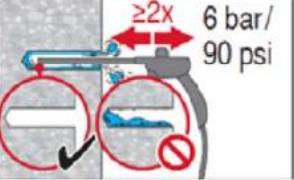

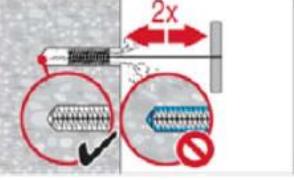

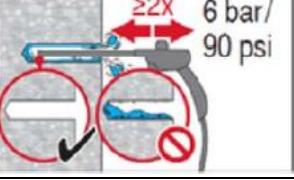

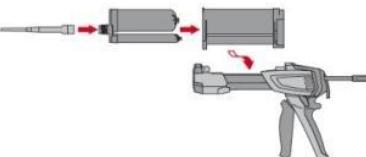

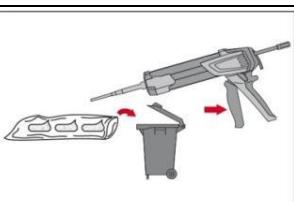

d) Cleaning of hammer drilled holes and diamond cored holesfor all bore hole diameters d_0 and all bore hole depth h_0 

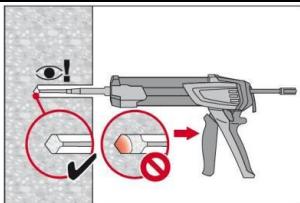

Flush 2 times the hole by inserting a water hose (water-line pressure) to the back of the hole until water runs clear.

Brush 2 times with the specified brush size by inserting the steel brush Hilti HIT-RB to the back of the hole (if needed with extension) in a twisting motion and removing it.

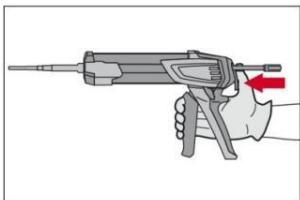

The brush must produce natural resistance as it enters the bore hole - if not the brush is too small and must be replaced with the proper brush diameter.

	<p>Flush again 2 times the hole by inserting a water hose (water-line pressure) to the back of the hole until water runs clear.</p>
	<p>Blow 2 times from the back of the hole (if needed with nozzle extension) over the hole length with oil-free compressed air (min. 6 bar at 6 m³/h) until return air stream is free of noticeable dust and water. Bore hole diameter ≥ 32 mm the compressor must supply a minimum air flow of 140 m³/hour.</p>
	<p>Brush 2 times with the specified brush size by inserting the steel brush Hilti HIT-RB to the back of the hole (if needed with extension) in a twisting motion and removing it. The brush must produce natural resistance as it enters the bore hole - if not the brush is too small and must be replaced with the proper brush diameter.</p>
	<p>Blow again with compressed air 2 times until return air stream is free of noticeable dust and water.</p>
<h3>Injection preparation</h3>	
	<p>Tightly attach new Hilti mixing nozzle HIT-RE-M to foil pack manifold (snug fit). Do not modify the mixing nozzle. Observe the instruction for use of the dispenser and mortar. Check foil pack holder for proper function. Do not use damaged foil packs / holders. Insert foil pack into foil pack holder and put holder into HIT-dispenser.</p>
	<p>The foil pack opens automatically as dispensing is initiated. Discard initial adhesive. Depending on the size of the foil pack an initial amount of adhesive has to be discarded. Discard quantities are: 2 strokes for 330 ml foil pack, 3 strokes for 500 ml foil pack, 65 ml for 1400 ml foil pack.</p>

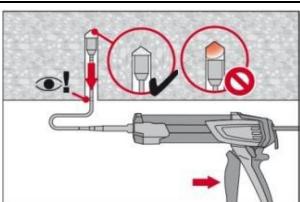

Inject adhesive from the back of the borehole without forming air voids

Inject the adhesive starting at the back of the hole, slowly withdrawing the mixer with each trigger pull.

Fill holes approximately 2/3 full. It is required that the annular gap between the anchor and the concrete is completely filled with adhesive along the embedment length.

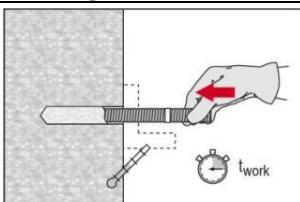

After injection is completed, depressurize the dispenser by pressing the release trigger. This will prevent further adhesive discharge from the mixer.

Overhead installation and/or installation with embedment depth $h_{ef} > 250\text{mm}$.

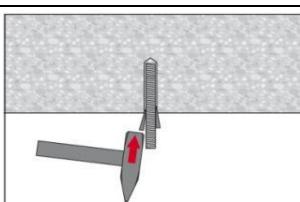

For overhead installation the injection is only possible with the aid of extensions and piston plugs. Assemble HIT-RE-M mixer, extension(s) and appropriately sized piston plug HIT-SZ. Insert piston plug to back of the hole and inject adhesive. During injection the piston plug will be naturally extruded out of the bore hole by the adhesive pressure.

Under water application: fill borehole completely with mortar.

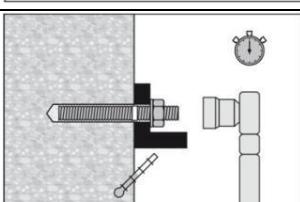

Setting the element

Before use, verify that the element is dry and free of oil and other contaminants.

Mark and set element to the required embedment depth until working time t_{work} has elapsed.

For overhead installation use piston plugs and fix embedded parts with e.g. wedges HIT-OHW.

Loading the anchor:

After required curing time t_{cure} the anchor can be loaded.
The applied installation torque shall not exceed T_{max} .

For detailed information on installation see instruction for use given with the package of the product.

Curing time for general conditions

Data according ETA-04/0027, issue 2013-06-26		
Temperature of the base material	Working time in which anchor can be inserted and adjusted t_{gel}	Curing time before anchor can be fully loaded t_{cure}
40 °C	12 min	4 h
30 °C to 39 °C	12 min	8 h
20 °C to 29 °C	20 min	12 h
15 °C to 19 °C	30 min	24 h
10 °C to 14 °C	90 min	48 h
5 °C to 9 °C	120 min	72 h

For dry concrete curing times may be reduced according to the following table.

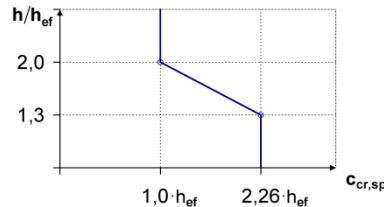

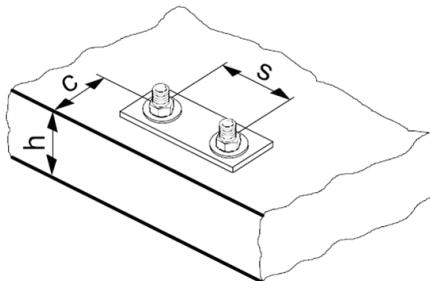

For installation temperatures below +5 °C all load values have to be reduced according to the load reduction factors given below.

Curing time for dry concrete

Additional Hilti technical data			
Temperature of the base material	Working time in which anchor can be inserted and adjusted t_{gel}	Reduced curing time before anchor can be fully loaded $t_{cure,dry}$	Load reduction factor
40 °C	12 min	4 h	1
30 °C	12 min	8 h	1
20 °C	20 min	12 h	1
15 °C	30 min	18 h	1
10 °C	90 min	24 h	1
5 °C	120 min	36 h	1
0 °C	3 h	50 h	0,7
-5 °C	4 h	72 h	0,6

Setting details

	Data according ETA-04/0027, issue 2013-06-26				
Anchor size	M8	M10	M12	M16	M20
Nominal diameter of drill bit d_0 [mm]	14	18	22	28	32
Diameter of element d [mm]	12,5	16,5	20,5	25,4	27,6
Effective anchorage and drill hole depth h_{ef} [mm]	90	110	125	170	205
Minimum base material thickness h_{min} [mm]	120	150	170	230	270
Diameter of clearance hole in the fixture d_f [mm]	9	12	14	18	22
Thread engagement length; min - max h_s [mm]	8-20	10-25	12-30	16-40	20-50
Minimum spacing s_{min} [mm]	40	45	55	65	90
Minimum edge distance c_{min} [mm]	40	45	55	65	90
Critical spacing for splitting failure $s_{cr,sp}$	$2 c_{cr,sp}$				
Critical edge distance for splitting failure ^{a)} $c_{cr,sp}$ [mm]	$1,0 \cdot h_{ef}$ for $h / h_{ef} \geq 2,0$				
	$4,6 h_{ef} - 1,8 h$ for $2,0 > h / h_{ef} > 1,3$				
	$2,26 h_{ef}$ for $h / h_{ef} \leq 1,3$				
Critical spacing for concrete cone failure $s_{cr,N}$	$2 c_{cr,N}$				
Critical edge distance for concrete cone failure ^{c)} $c_{cr,N}$	$1,5 h_{ef}$				
Torque moment ^{c)} T_{max} [Nm]	10	20	40	80	150

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced.

- a) h : base material thickness ($h \geq h_{min}$)
- b) The critical edge distance for concrete cone failure depends on the embedment depth h_{ef} and the design bond resistance. The simplified formula given in this table is on the safe side.
- c) This is the maximum recommended torque moment to avoid splitting failure during installation for anchors with minimum spacing and/or edge distance.

Simplified design method

Simplified version of the design method according ETAG 001, TR 029. Design resistance according data given in ETA-04/0027, issue 2013-06-26.

- Influence of concrete strength
- Influence of edge distance
- Influence of spacing
- Valid for a group of two anchors. (The method may also be applied for anchor groups with more than two anchors or more than one edge distance. The influencing factors must then be considered for each edge distance and spacing. The calculated design loads are then on the same side: They will be lower than the exact values according ETAG 001, TR 029. To avoid this, it is recommended to use the anchor design software PROFIS anchor)

The design method is based on the following simplification:

- No different loads are acting on individual anchors (no eccentricity)

The values are valid for one anchor.

For more complex fastening applications please use the anchor design software PROFIS Anchor.

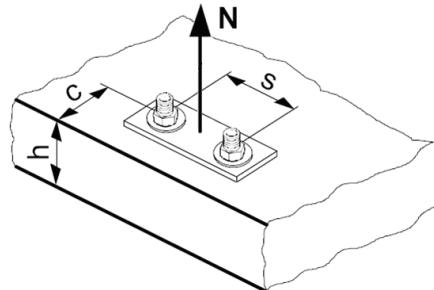

Tension loading

The design tensile resistance is the lower value of

- Steel resistance: $N_{Rd,s}$
- Combined pull-out and concrete cone resistance:

$$N_{Rd,p} = N_{Rd,c}^0 \cdot f_{B,p} \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,p} \cdot f_{re,N}$$
- Concrete cone resistance: $N_{Rd,c} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,N} \cdot f_{re,N}$
- Concrete splitting resistance (only non-cracked concrete):

$$N_{Rd,sp} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,N} \cdot f_{re,N}$$

Basic design tensile resistance

Design steel resistance $N_{Rd,s}$

$N_{Rd,c}^0$ [kN]		20,5	27,7	33,6	53,3	70,6

- a) Additional Hilti technical data (not part of ETA-04/0027, issue 2009-05-20):

The design values for concrete cone and splitting resistance may be increased by 20 % for anchor installation in dry concrete (concrete not in contact with water before/during installation and curing).

Influencing factors

Influence of concrete strength on combined pull-out and concrete cone resistance

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_{B,p} = (f_{ck,cube}/25N/mm^2)^{0,1}$ ^{a)}	1	1,02	1,04	1,06	1,07	1,08	1,09

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of embedment depth on combined pull-out and concrete cone resistance

$$f_{h,p} = 1$$

Influence of concrete strength on concrete cone resistance

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25N/mm^2)^{1/2}$ ^{a)}	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of edge distance ^{a)}

$c/c_{cr,N}$	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$c/c_{cr,sp}$										
$f_{1,N} = 0,7 + 0,3 \cdot c/c_{cr,N}$	0,73	0,76	0,79	0,82	0,85	0,88	0,91	0,94	0,97	1
$f_{1,sp} = 0,7 + 0,3 \cdot c/c_{cr,sp}$										
$f_{2,N} = 0,5 \cdot (1 + c/c_{cr,N})$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{2,sp} = 0,5 \cdot (1 + c/c_{cr,sp})$										

- a) The the edge distance shall not be smaller than the minimum edge distance c_{min} given in the table with the setting details. These influencing factors must be considered for every edge distance smaller than the critical edge distance.

Influence of anchor spacing ^{a)}

$s/s_{cr,N}$	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$s/s_{cr,sp}$										
$f_{3,N} = 0,5 \cdot (1 + s/s_{cr,N})$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{3,sp} = 0,5 \cdot (1 + s/s_{cr,sp})$										

- a) The anchor spacing shall not be smaller than the minimum anchor spacing s_{min} given in the table with the setting details. This influencing factor must be considered for every anchor spacing.

Influence of embedment depth on concrete cone resistance

$$f_{h,N} = 1$$

Influence of reinforcement

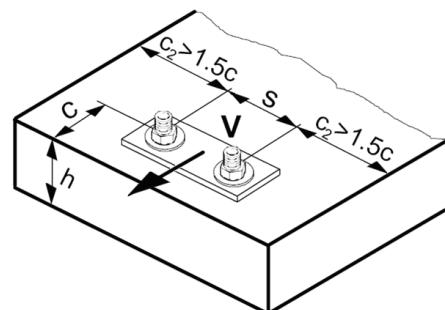

$h_{ef} [\text{mm}]$	80	90	≥ 100
$f_{re,N} = 0,5 + h_{ef}/200\text{mm} \leq 1$	0,9 ^{a)}	0,95 ^{a)}	1

- a) This factor applies only for dense reinforcement. If in the area of anchorage there is reinforcement with a spacing ≥ 150 mm (any diameter) or with a diameter ≤ 10 mm and a spacing ≥ 100 mm, then a factor $f_{re} = 1$ may be applied.

Shear loading

The design shear resistance is the lower value of

- Steel resistance: $V_{Rd,s}$
- Concrete prout resistance: $V_{Rd,sp} = k \cdot \text{lower value of } N_{Rd,p} \text{ and } N_{Rd,c}$
- Concrete edge resistance: $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_B \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Basic design shear resistance

Design steel resistance $V_{Rd,s}$

		Data according ETA-04/0027, issue 2013-06-26				
Anchor size		M8	M10	M12	M16	M20
V _{Rd,s}	HIS-N [kN]	10,4	18,4	26,0	39,3	36,7
V _{Rd,s}	HIS-RN [kN]	8,3	12,8	19,2	35,3	41,5

Design concrete prerot resistance $V_{Rd,cp} = \text{lower value}^a)$ of $k \cdot N_{Rd,p}$ and $k \cdot N_{Rd,c}$

$k = 1$ for $h_{ef} < 60$ mm

$k = 2$ for $h_{ef} \geq 60$ mm

a) $N_{Rd,p}$: Design combined pull-out and concrete cone resistance

$N_{Rd,c}$: Design concrete cone resistance

Design concrete edge resistance $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_\beta \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Anchor size	M8	M10	M12	M16	M20
Non-cracked concrete					
$V_{Rd,c}^0$ [kN]	12,4	19,6	28,2	40,2	46,2

Influencing factors

Influence of concrete strength

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25\text{N/mm}^2)^{1/2}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of angle between load applied and the direction perpendicular to the free edge

Angle β	0°	10°	20°	30°	40°	50°	60°	70°	80°	≥ 90°
$f_\beta = \sqrt{\frac{1}{(\cos \alpha_v)^2 + \left(\frac{\sin \alpha_v}{2,5}\right)^2}}$	1	1,01	1,05	1,13	1,24	1,40	1,64	1,97	2,32	2,50

Influence of base material thickness

h/c	0,15	0,3	0,45	0,6	0,75	0,9	1,05	1,2	1,35	≥ 1,5
$f_h = \{h/(1,5 \cdot c)\}^{1/2} \leq 1$	0,32	0,45	0,55	0,63	0,71	0,77	0,84	0,89	0,95	1,00

Influence of anchor spacing and edge distance ^{a)} for concrete edge resistance: f_4
 $f_4 = (c/h_{ef})^{1,5} \cdot (1 + s / [3 \cdot c]) \cdot 0,5$

c/h _{ef}	Single anchor	Group of two anchors s/h _{ef}

$f_c = (d / c)^{0,19}$	0,77	0,71	0,67	0,65	0,60	0,57	0,52	0,50

a) The edge distance shall not be smaller than the minimum edge distance c_{min} .

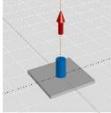

Combined tension and shear loading for hammer drilling or hollow drill bit

For combined tension and shear loading see section "Anchor Design".

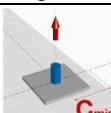

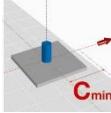

Precalculated values

Recommended loads can be calculated by dividing the design resistance by an overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Description	Authority / Laboratory	No. / date of issue
European technical approval ^{a)}	DIBt, Berlin	ETA-04/0027 / 2013-06-26

a) All data given in this section according ETA-04/0027, issue 2013-06-26

Basic loading data (for a single anchor)

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Steel failure
- Base material thickness, as specified in the table
- One typical embedment depth, as specified in the table
- One anchor material, as specified in the tables
- Concrete C 20/25, $f_{ck,cube} = 25 \text{ N/mm}^2$
- Temperate range I
(min. base material temperature -40°C, max. long term/short term base material temperature: +24°C/40°C)
- Installation temperature range +5°C to +40°C

For details see Simplified design method

Embedment depth ^{a)} and base material thickness for the basic loading data. Mean ultimate resistance, characteristic resistance, design resistance, recommended loads.

	ETA-04/0027, issue issue 2013-06-26										Additional Hilti tech. data
	Ø8	Ø10	Ø12	Ø14	Ø16	Ø20	Ø25	Ø28	Ø32	Ø36	Ø40
Anchor size											
Typical embedment depth [mm]	80	90	110	125	125	170	210	270	300	330	360

- a) With overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Service temperature range

Hilti HIT-RE 500 injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

Temperature range	Base material temperature	Maximum long term base material temperature	Maximum short term base material temperature
Temperature range I	-40 °C to +40 °C	+24 °C	+40 °C
Temperature range II	-40 °C to +58 °C	+35 °C	+58 °C
Temperature range III	-40 °C to +70 °C	+43 °C	+70 °C

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

Setting

Installation equipment

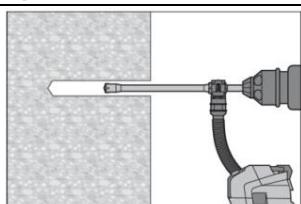

Anchor size	Ø8	Ø10	Ø12	Ø14	Ø16	Ø20	Ø25	Ø28	Ø32	Ø36
Rotary hammer	TE 2 – TE 16						TE 40 – TE 70			
Other tools	compressed air gun or blow out pump, set of cleaning brushes, dispenser									

Setting instruction

Bore hole drilling

a) Hilti hollow drill bit

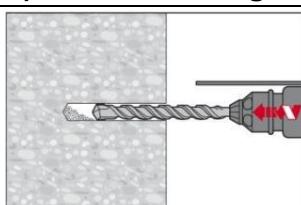

(for dry and wet concrete only)

Drill hole to the required embedment depth with an appropriately sized Hilti TE-CD or TE-YD hollow drill bit with Hilti vacuum attachment. This drilling system removes the dust and cleans the bore hole during drilling when used in accordance with the user's manual.
After drilling is complete, proceed to the "injection preparation" step in the instructions for use.

b) Hammer drilling

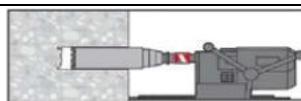

(dry or wet concrete and installation in flooded holes (no sea water))

Drill Hole to the required embedment depth with a hammer drill set in rotation-hammer mode using an appropriately sized carbide drill bit.

c) Diamond coring

(for dry and wet concrete only)

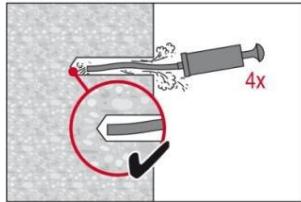

Diamond coring is permissible when diamond core drilling machine and the corresponding core bit are used.

Bore hole cleaning

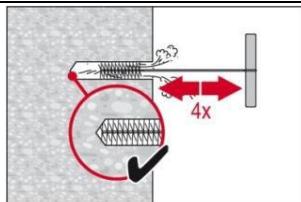

Just before setting an anchor, the bore hole must be free of dust and debris.

a) Manual Cleaning (MC) non-cracked concrete only

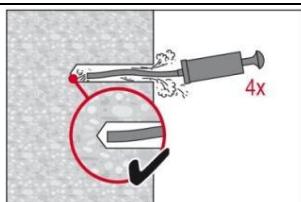

for bore hole diameters $d_0 \leq 20\text{mm}$ and bore hole depth $h_0 \leq 20d$ or $h_0 \leq 250\text{ mm}$ (d = diameter of element)

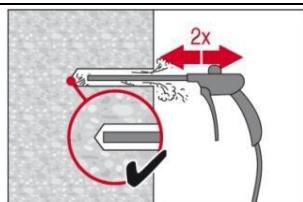

The Hilti manual pump may be used for blowing out bore holes up to diameters $d_0 \leq 20\text{ mm}$ and embedment depths up to $h_{ef} \leq 10d$.
Blow out at least 4 times from the back of the bore hole until return air stream is free of noticeable dust

Brush 4 times with the specified brush size (brush diameter \geq bore hole) by inserting the steel brush Hilti HIT-RB to the back of the hole (if needed with extension) in a twisting motion and removing it.
The brush must produce natural resistance as it enters the bore hole - if not the brush is too small and must be replaced with the proper brush diameter.

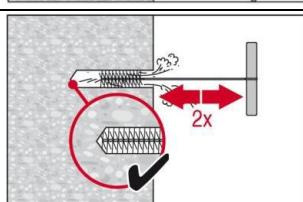

Blow out again with manual pump at least 4 times until return air stream is free of noticeable dust.

b) Compressed air cleaning (CAC)for all bore hole diameters d_0 and all bore hole depth h_0 

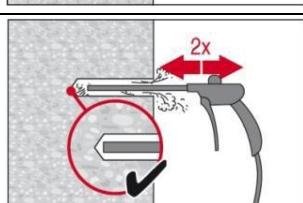

Blow 2 times from the back of the hole (if needed with nozzle extension) over the hole length with oil-free compressed air (min. 6 bar at 6 m³/h) until return air stream is free of noticeable dust.

Bore hole diameter ≥ 32 mm the compressor must supply a minimum air flow of 140 m³/hour.

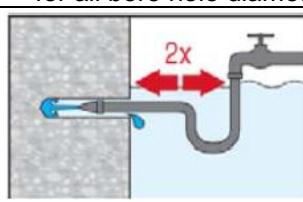

Brush 2 times with the specified brush size by inserting the steel brush Hilti HIT-RB to the back of the hole (if needed with extension) in a twisting motion and removing it.

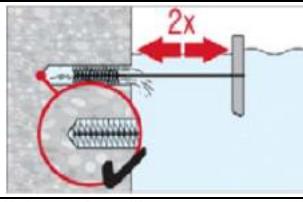

The brush must produce natural resistance as it enters the bore hole - if not the brush is too small and must be replaced with the proper brush diameter.

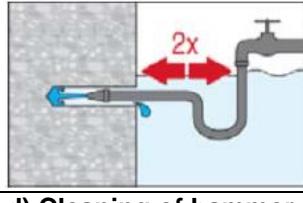

Blow again with compressed air 2 times until return air stream is free of noticeable dust.

c) Cleaning for under waterfor all bore hole diameters d_0 and all bore hole depth h_0 

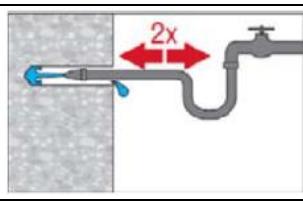

Flush 2 times the hole by inserting a water hose (water-line pressure) to the back of the hole until water runs clear.

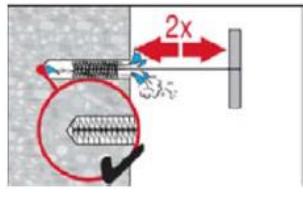

Brush 2 times with the specified brush size by inserting the steel brush Hilti HIT-RB to the back of the hole (if needed with extension) in a twisting motion and removing it.
The brush must produce natural resistance as it enters the bore hole - if not the brush is too small and must be replaced with the proper brush diameter.

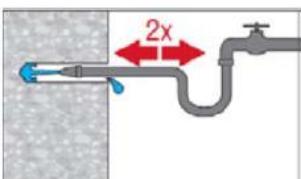

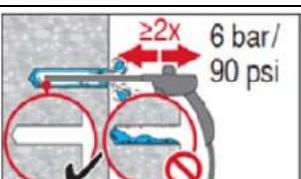

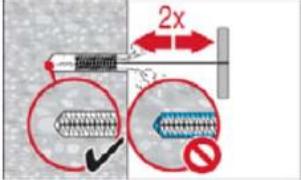

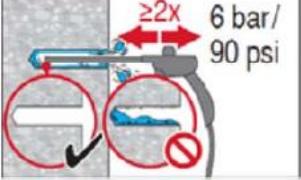

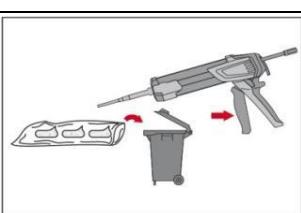

Flush again 2 times the hole by inserting a water hose (water-line pressure) to the back of the hole until water runs clear.

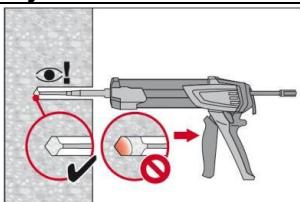

d) Cleaning of hammer drilled holes and diamond cored holesfor all bore hole diameters d_0 and all bore hole depth h_0 

Flush 2 times the hole by inserting a water hose (water-line pressure) to the back of the hole until water runs clear.

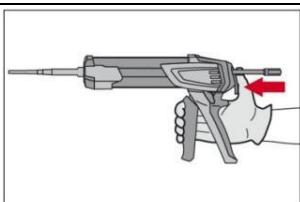

Brush 2 times with the specified brush size by inserting the steel brush Hilti HIT-RB to the back of the hole (if needed with extension) in a twisting motion and removing it.
The brush must produce natural resistance as it enters the bore hole - if not the brush is too small and must be replaced with the proper brush diameter.

	<p>Flush again 2 times the hole by inserting a water hose (water-line pressure) to the back of the hole until water runs clear.</p>
	<p>Blow 2 times from the back of the hole (if needed with nozzle extension) over the hole length with oil-free compressed air (min. 6 bar at 6 m³/h) until return air stream is free of noticeable dust and water.</p> <p>Bore hole diameter ≥ 32 mm the compressor must supply a minimum air flow of 140 m³/hour.</p>
	<p>Brush 2 times with the specified brush size by inserting the steel brush Hilti HIT-RB to the back of the hole (if needed with extension) in a twisting motion and removing it.</p> <p>The brush must produce natural resistance as it enters the bore hole - if not the brush is too small and must be replaced with the proper brush diameter.</p>
	<p>Blow again with compressed air 2 times until return air stream is free of noticeable dust and water.</p>
<h3>Injection preparation</h3>	<p>Tightly attach new Hilti mixing nozzle HIT-RE-M to foil pack manifold (snug fit). Do not modify the mixing nozzle. Observe the instruction for use of the dispenser and mortar.</p> <p>Check foil pack holder for proper function. Do not use damaged foil packs / holders.</p> <p>Insert foil pack into foil pack holder and put holder into HIT-dispenser.</p>
	<p>The foil pack opens automatically as dispensing is initiated. Discard initial adhesive. Depending on the size of the foil pack an initial amount of adhesive has to be discarded.</p> <p>Discard quantities are:</p> <ul style="list-style-type: none"> 2 strokes for 330 ml foil pack, 3 strokes for 500 ml foil pack, 65 ml for 1400 ml foil pack.

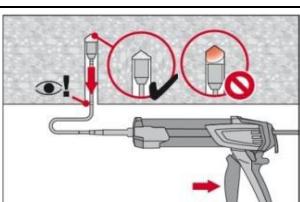

Inject adhesive from the back of the borehole without forming air voids

Inject the adhesive starting at the back of the hole, slowly withdrawing the mixer with each trigger pull.

Fill holes approximately 2/3 full. It is required that the annular gap between the anchor and the concrete is completely filled with adhesive along the embedment length.

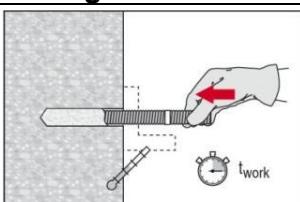

After injection is completed, depressurize the dispenser by pressing the release trigger. This will prevent further adhesive discharge from the mixer.

Overhead installation and/or installation with embedment depth $h_{ef} > 250\text{mm}$.

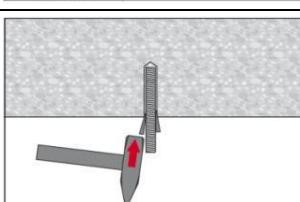

For overhead installation the injection is only possible with the aid of extensions and piston plugs. Assemble HIT-RE-M mixer, extension(s) and appropriately sized piston plug HIT-SZ. Insert piston plug to back of the hole and inject adhesive. During injection the piston plug will be naturally extruded out of the bore hole by the adhesive pressure.

Under water application: fill borehole completely with mortar.

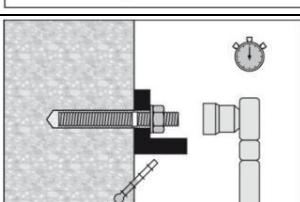

Setting the element

Before use, verify that the element is dry and free of oil and other contaminants.

Mark and set element to the required embedment depth until working time t_{work} has elapsed.

For overhead installation use piston plugs and fix embedded parts with e.g. wedges HIT-OHW.

Loading the anchor:

After required curing time t_{cure} the anchor can be loaded.
The applied installation torque shall not exceed T_{max} .

For detailed information on installation see instruction for use given with the package of the product.

Curing time for general conditions

Data according ETA-04/0027, issue 2013-06-26			Additional Hilti technical data
Temperature of the base material	Working time in which anchor can be inserted and adjusted t_{gel}	Curing time before anchor can be fully loaded t_{cure}	Preparation work may continue. Do not apply design load. $t_{cure, ini}$
40 °C	12 min	4 h	2 h
30 °C to 39 °C	12 min	8 h	4 h
20 °C to 29 °C	20 min	12 h	6 h
15 °C to 19 °C	30 min	24 h	8 h
10 °C to 14 °C	90 min	48 h	12 h
5 °C to 9 °C	120 min	72 h	18 h

For dry concrete curing times may be reduced according to the following table.

For installation temperatures below +5 °C all load values have to be reduced according to the load reduction factors given below.

Curing time for dry concrete

Additional Hilti technical data			
Temperature of the base material	Working time in which anchor can be inserted and adjusted t_{gel}	Reduced curing time before anchor can be fully loaded $t_{cure,dry}$	Load reduction factor
40 °C	12 min	4 h	1
30 °C	12 min	8 h	1

15 °C	30 min	18 h	1
10 °C	90 min	24 h	1
5 °C	120 min	36 h	1
0 °C	3 h	50 h	0,7
-5 °C	4 h	72 h	0,6

Setting details

	Data according ETA-04/0027, issue 2013-06-26										Additional Hilti tech. data	
Anchor size	$\varnothing 8$	$\varnothing 10$	$\varnothing 12$	$\varnothing 14$	$\varnothing 16$	$\varnothing 20$	$\varnothing 25$	$\varnothing 28$	$\varnothing 32$	$\varnothing 36$	$\varnothing 40$	
Nominal diameter of drill bit d_0 [mm]	12	14	16	18	20	25	32	35	40	45	55	
Effective anchorage and drill hole depth range a)	$h_{ef,min}$ [mm]	60	60	70	75	80	90	100	112	128	144	160
	$h_{ef,max}$ [mm]	160	200	240	280	320	400	500	560	640	720	800
Minimum base material thickness h_{min} [mm]	$h_{ef} + 30 \text{ mm}$ $\geq 100 \text{ mm}$		$h_{ef} + 2 d_0$									
Minimum spacing s_{min} [mm]	40	50	60	70	80	100	125	140	160	180	200	
Minimum edge distance c_{min} [mm]	40	50	60	70	80	100	125	140	160	180	200	
Critical spacing for splitting failure $s_{cr,sp}$	$2 c_{cr,sp}$											
Critical edge distance for splitting failure b) c _{cr,sp} [mm]	$1,0 \cdot h_{ef}$ for $h / h_{ef} \geq 2,0$											
	$4,6 h_{ef} - 1,8 h$ for $2,0 > h / h_{ef} > 1,3$											
	$2,26 h_{ef}$ for $h / h_{ef} \leq 1,3$											
Critical spacing for concrete cone failure $s_{cr,N}$	$2 c_{cr,N}$											
Critical edge distance for concrete cone failure c) c _{cr,N}	$1,5 h_{ef}$											

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced.

- a) $h_{ef,min} \leq h_{ef} \leq h_{ef,max}$ (h_{ef} : embedment depth)
- b) h : base material thickness ($h \geq h_{min}$)
- c) The critical edge distance for concrete cone failure depends on the embedment depth h_{ef} and the design bond resistance. The simplified formula given in this table is on the save side.

Simplified design method

Simplified version of the design method according ETAG 001, TR 029. Design resistance according data given in ETA-04/0027, issue 2013-06-26.

- Influence of concrete strength
- Influence of edge distance
- Influence of spacing
- Valid for a group of two anchors. (The method may also be applied for anchor groups with more than two anchors or more than one edge distance. The influencing factors must then be considered for each edge distance and spacing. The calculated design loads are then on the same side: They will be lower than the exact values according ETAG 001, TR 029. To avoid this, it is recommended to use the anchor design software PROFIS anchor)

The design method is based on the following simplification:

- No different loads are acting on individual anchors (no eccentricity)

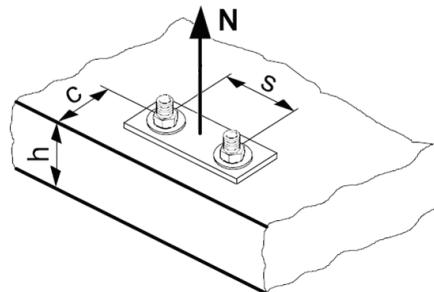

The values are valid for one anchor.

For more complex fastening applications please use the anchor design software PROFIS Anchor.

Tension loading

The design tensile resistance is the lower value of

- Steel resistance: $N_{Rd,s}$
- Combined pull-out and concrete cone resistance: $N_{Rd,p} = N^0_{Rd,p} \cdot f_{B,p} \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,p} \cdot f_{re,N}$
- Concrete cone resistance: $N_{Rd,c} = N^0_{Rd,c} \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,N} \cdot f_{re,N}$
- Concrete splitting resistance (only non-cracked concrete): $N_{Rd,sp} = N^0_{Rd,sp} \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,N} \cdot f_{re,N}$

Basic design tensile resistance

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of embedment depth on combined pull-out and concrete cone resistance

$$f_{h,p} = h_{ef}/h_{ef,typ}$$

Influence of concrete strength on concrete cone resistance

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25N/mm^2)^{1/2}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of edge distance a)

c/c _{cr,N}	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$f_{1,N} = 0,7 + 0,3 \cdot c/c_{cr,N}$	0,73	0,76	0,79	0,82	0,85	0,88	0,91	0,94	0,97	1
$f_{1,sp} = 0,7 + 0,3 \cdot c/c_{cr,sp}$										
$f_{2,N} = 0,5 \cdot (1 + c/c_{cr,N})$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{2,sp} = 0,5 \cdot (1 + c/c_{cr,sp})$										

a) The the edge distance shall not be smaller than the minimum edge distance c_{min} given in the table with the setting details. These influencing factors must be considered for every edge distance smaller than the critical edge distance.

Influence of anchor spacing a)

s/s _{cr,N}	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$f_{3,N} = 0,5 \cdot (1 + s/s_{cr,N})$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{3,sp} = 0,5 \cdot (1 + s/s_{cr,sp})$										

a) The anchor spacing shall not be smaller than the minimum anchor spacing s_{min} given in the table with the setting details. This influencing factor must be considered for every anchor spacing.

Influence of embedment depth on concrete cone resistance

$$f_{h,N} = (h_{ef}/h_{ef,typ})^{1,5}$$

Influence of reinforcement

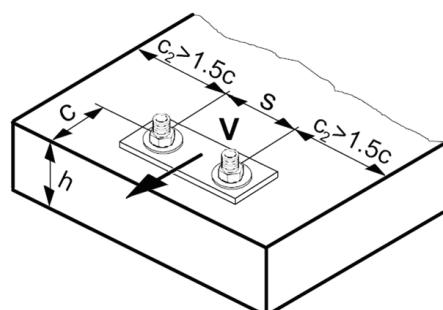

h _{ef} [mm]	40	50	60	70	80	90	≥ 100
$f_{re,N} = 0,5 + h_{ef}/200\text{mm} \leq 1$	0,7 a)	0,75 a)	0,8 a)	0,85 a)	0,9 a)	0,95 a)	1

a) This factor applies only for dense reinforcement. If in the area of anchorage there is reinforcement with a spacing ≥ 150 mm (any diameter) or with a diameter ≤ 10 mm and a spacing ≥ 100 mm, then a factor $f_{re} = 1$ may be applied.

Shear loading

The design shear resistance is the lower value of

- Steel resistance: $V_{Rd,s}$
- Concrete prout resistance: $V_{Rd,cp} = k \cdot \text{lower value of } N_{Rd,p} \text{ and } N_{Rd,c}$
- Concrete edge resistance: $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_B \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Basic design shear resistance

Design steel resistance $V_{Rd,s}$

Influencing factors

Influence of concrete strength

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25N/mm^2)^{1/2}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

- a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of angle between load applied and the direction perpendicular to the free edge

Angle β	0°	10°	20°	30°	40°	50°	60°	70°	80°	$\geq 90^\circ$
$f_\beta = \sqrt{\frac{1}{(\cos \alpha_v)^2 + \left(\frac{\sin \alpha_v}{2,5}\right)^2}}$	1	1,01	1,05	1,13	1,24	1,40	1,64	1,97	2,32	2,50

Influence of base material thickness

h/c	0,15	0,3	0,45	0,6	0,75	0,9	1,05	1,2	1,35	$\geq 1,5$
$f_h = \{h/(1,5 \cdot c)\}^{1/2} \leq 1$	0,32	0,45	0,55	0,63	0,71	0,77	0,84	0,89	0,95	1,00

Influence of anchor spacing and edge distance ^{a)} for concrete edge resistance: f_4
 $f_4 = (c/h_{ef})^{1,5} \cdot (1 + s / [3 \cdot c]) \cdot 0,5$

c/h _{ef}	Single anchor	Group of two anchors s/h _{ef}														
		0,75	1,50	2,25	3,00	3,75	4,50	5,25	6,00	6,75	7,50	8,25	9,00	9,75	10,50	11,25

a) The anchor spacing and the edge distance shall not be smaller than the minimum anchor spacing s_{min} and the minimum edge distance c_{min} .

Influence of embedment depth

h_{ef}/d	4	4,5	5	6	7	8	9	10	11
$f_{hef} = 0,05 \cdot (h_{ef} / d)^{1,68}$	0,51	0,63	0,75	1,01	1,31	1,64	2,00	2,39	2,81
h_{ef}/d	12	13	14	15	16	17	18	19	20
$f_{hef} = 0,05 \cdot (h_{ef} / d)^{1,68}$	3,25	3,72	4,21	4,73	5,27	5,84	6,42	7,04	7,67

Influence of edge distance ^{a)}

c/d	4	6	8	10	15	20	30	40
$f_c = (d / c)^{0,19}$	0,77	0,71	0,67	0,65	0,60	0,57	0,52	0,50

a) The edge distance shall not be smaller than the minimum edge distance c_{min} .

Combined tension and shear loading for hammer drilling or hollow drill bit

For combined tension and shear loading see section "Anchor Design".

Precalculated values

Recommended loads can be calculated by dividing the design resistance by an overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Design resistance: concrete C 20/25 – $f_{ck,cube} = 25 \text{ N/mm}^2$, Temperature range I

Description	Authority / Laboratory	No. / date of issue
European technical approval ^{a)}	DIBt, Berlin	ETA-12/0006 / 2013-03-15 (HIT-HY 200-A) ETA-12/0028 / 2013-03-15 (HIT-HY 200-R)
Fire test report	IBMB, Brunswick	3501/676/13 / 2012-08-03

a) All data given in this section according ETA-12/0006 and ETA-12/0028, issue 2013-03-15.

Basic loading data (for a single anchor)

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Steel failure
- Base material thickness, as specified in the table
- Embedment depth, as specified in the table
- One anchor material, as specified in the tables
- Concrete C 20/25, $f_{ck,cube} = 25 \text{ N/mm}^2$
- Temperate range I
(min. base material temperature -40°C, max. long term/short term base material temperature: +24°C/40°C)
- Installation temperature range +5°C to +40°C

For details see Simplified design method

Embedment depth and base material thickness for the basic loading data. Mean ultimate resistance, characteristic resistance, design resistance, recommended loads.

Anchor size	M8	M10	M12	M16	M20
Typical embedment depth [mm]	70	90	110	145	180
Base material thickness [mm]	130	150	170	245	280

Mean ultimate resistance: concrete C 20/25 – $f_{ck,cube} = 25 \text{ N/mm}^2$, element HIT-Z

Anchor size	M8	M10	M12	M16	M20
Non-cracked concrete

a) With overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Service temperature range

Hilti HIT-HY 200 injection mortar with anchor rod HIT-Z may be applied in the temperature ranges given below. An elevated base material temperature leads to a reduction of the design bond resistance.

Temperature range	Base material temperature	Maximum long term base material temperature	Maximum short term base material temperature
Temperature range I	-40 °C to +40 °C	+24 °C	+40 °C
Temperature range II	-40 °C to +80 °C	+40 °C	+80 °C
Temperature range III	-40 °C to +120 °C	+72 °C	+120 °C

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

Materials

Mechanical properties of HIT-Z and HIT-Z-R

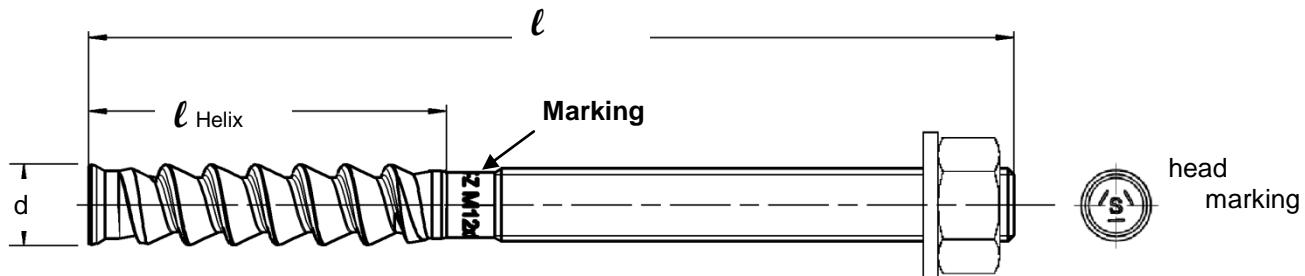

Anchor size	M8	M10	M12	M16	M20

21 °C to 30 °C	4 min	30 min
31 °C to 40 °C	3 min	30 min

Setting instruction

Bore hole drilling

Pre-setting: Drill hole to the required drilling depth with a hammer drill set in rotation-hammer mode using an appropriately sized carbide drill bit. Diamond coring is permissible when diamond core drilling machine and the corresponding core bit are used.

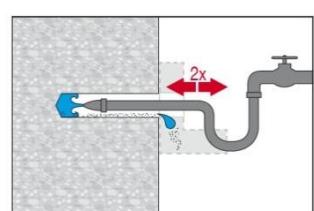

Through-setting: Drill hole through the clearance hole in the fixture to the required drilling depth with a hammer drill set in rotation-hammer mode using an appropriately sized carbide drill bit. Diamond coring is permissible when diamond core drilling machine and the corresponding core bit are used.

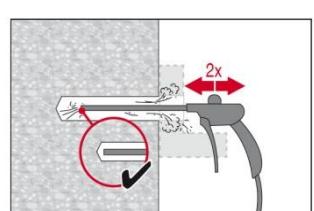

Bore hole cleaning^{a)}

a) No cleaning required for hammer drilled boreholes

b) Hole flushing and evacuation for wet-drilled diamond cored holes or flooded holes

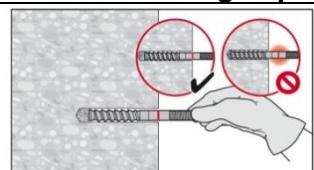

Flush 2 times from the back of the hole over the hole length.

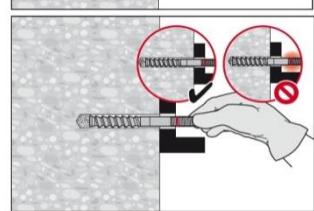

Blow 2 times the hole with oil-free compressed air (min. 6 bar at 6 m³/h) to evacuate the water

Check of setting depth and compress of the drilling dust

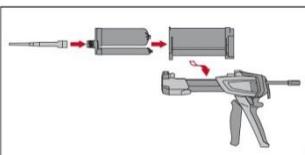

Mark the element and check the setting depth and compress the drilling dust. The element has to fit in the hole until the required embedment depth.

If it is not possible to compress the dust, remove the dust in the drill hole or drill deeper.

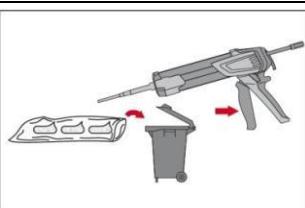

- a) When drilling downward with non-cleaning the required drilling depths can vary due to accumulation of dust in the hole.

Injection preparation

Tightly attach new Hilti mixing nozzle HIT-RE-M to foil pack manifold (snug fit). Do not modify the mixing nozzle. Observe the instruction for use of the dispenser.

Check foil pack holder for proper function. Do not use damaged foil packs / holders. Swing foil pack holder with foil pack into HIT-dispenser.

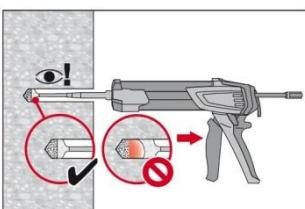

Discard initial adhesive. The foil pack opens automatically as dispensing is initiated. Depending on the size of the foil pack an initial amount of adhesive has to be discarded.

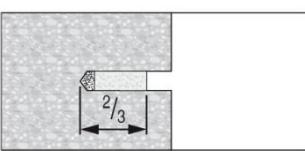

Discard quantities are

2 strokes for 330 ml foil pack

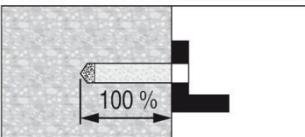

3 strokes for 500 ml foil pack

Inject adhesive from the back of the borehole without forming air voids

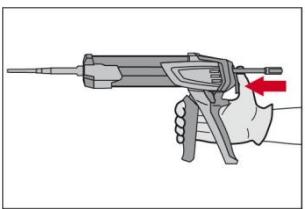

Inject the adhesive starting at the back of the hole, slowly withdrawing the mixer with each trigger pull.

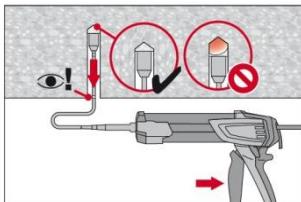

Fill holes approximately 2/3 full for Pre-setting and 100% full for through-setting, or as required to ensure that the annular gap between the anchor and the concrete is completely filled with adhesive along the embedment length.

After injection is completed, depressurize the dispenser by pressing the release trigger. This will prevent further adhesive discharge from the mixer.

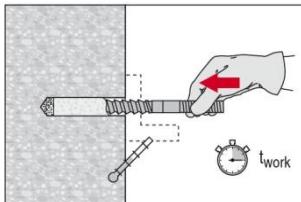

Overhead installation

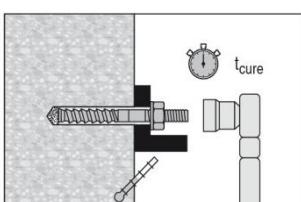

For overhead installation the injection is only possible with the aid of extensions and piston plugs. Assemble HIT-RE-M mixer, extension(s) and appropriately piston plug HIT-SZ. Insert piston plug to back of the hole and inject adhesive. During injection the piston plug will be naturally extruded out of the bore hole by the adhesive pressure

Setting the element

Before use, verify that the element is dry and free of oil and other contaminants. Set element to the required embedment depth until working time t_{work} has elapsed.

After setting the element the annular gap between the anchor and the fixture (through-setting) or concrete (pre-setting) has to be completely filled with mortar.

After required curing time t_{cure} remove excess mortar. Apply indicated torque moment to activate anchor functioning principles. The anchor can be loaded.

For detailed information on installation see instruction for use given with the package of the product.

Setting details

Anchor size	M8	M10	M12	M16	M20
Nominal diameter of drill bit d_0 [mm]	10	12	14	18	22
Nominal embedment depth range $h_{nom,min}$ [mm]	60	60	60	96	100
	$h_{nom,max}$ [mm]	100	120	150	200
Borehole condition 1 Minimum base material thickness h_{min} [mm]	$h_{nom} + 60$ mm			$h_{nom} + 100$ mm	
Borehole condition 2 Minimum base material thickness h_{min} [mm]	$h_{nom} + 30$ mm ≥ 100 mm			$h_{nom} + 45$ mm ≥ 45 mm	
Pre-setting: Diameter of clearance hole in the fixture $d_f \leq$ [mm]	9	12	14	18	22
Through-setting: Diameter of clearance hole in the fixture $d_f \leq$ [mm]	11	14	16	20	24
Torque moment T_{inst} [Nm]	10	25	40	80	150

Critical edge distance and critical spacing

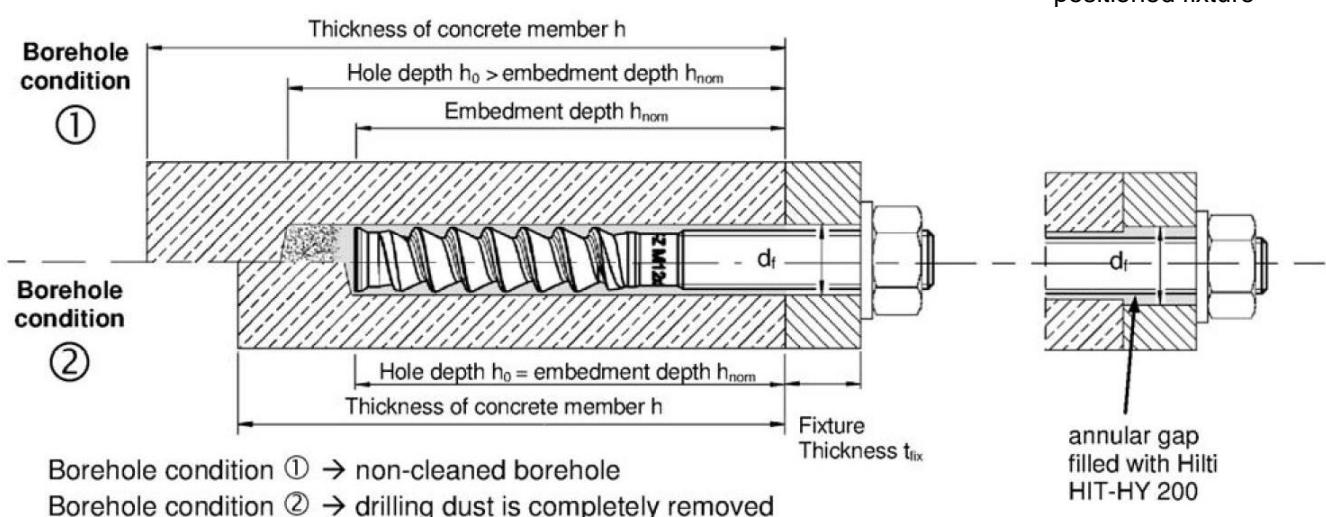

Critical spacing for splitting failure	$s_{cr,sp}$ [mm]	$2 c_{cr,sp}$
Critical edge distance for splitting failure	$c_{cr,sp}$ [mm]	$1,5 \cdot h_{nom}$ for $h / h_{nom} \geq 2,35$
		$6,2 h_{nom} - 2,0 h$ for $2,35 > h / h_{nom} > 1,35$
		$3,5 h_{nom}$ for $h / h_{nom} \leq 1,35$
Critical spacing for concrete cone failure	$s_{cr,N}$ [mm]	$2 c_{cr,N}$
Critical edge distance for concrete cone failure	$c_{cr,N}$ [mm]	$1,5 h_{nom}$

For spacing (or edge distance) smaller than critical spacing (or critical edge distance) the design loads have to be reduced.

- a) Embedment depth range: $h_{nom,min} \leq h_{nom} \leq h_{nom,max}$

Pre-setting:
Install anchor before positioning fixture

Through-setting:
Install anchor through positioned fixture

Minimum edge distance and spacing

For the calculation of minimum spacing and minimum edge distance of anchors in combination with different embedment depth and thickness of concrete member the following equation shall be fulfilled:

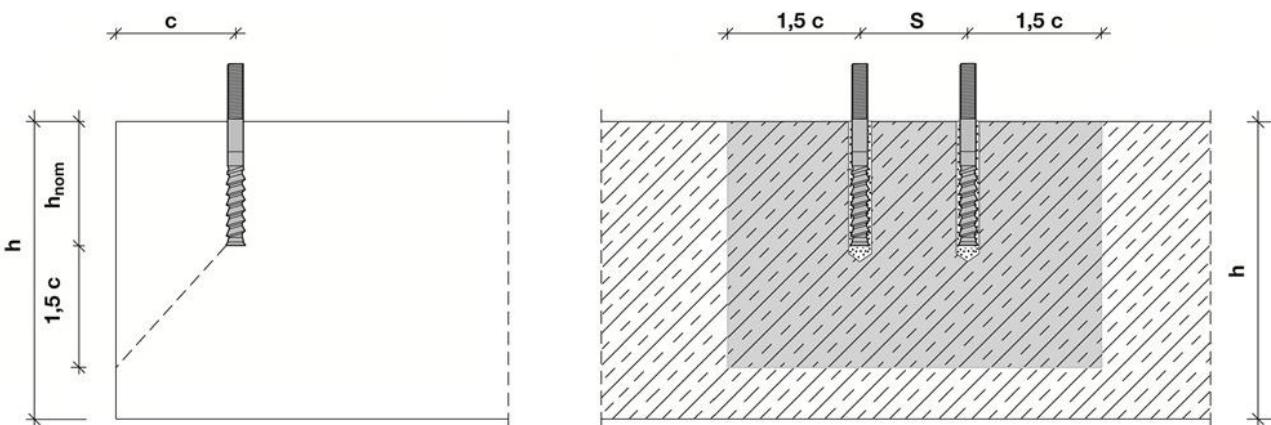

$$A_{i,req} < A_{i,cal}$$

Required interaction area $A_{i,req}$

Anchor size	M8	M10	M12	M16	M20
Cracked concrete [mm ²]	19200	40800	58800	94700	148000
Uncracked concrete [mm ²]	22200	57400	80800	128000	198000

Calculate interaction area $A_{i,cal}$

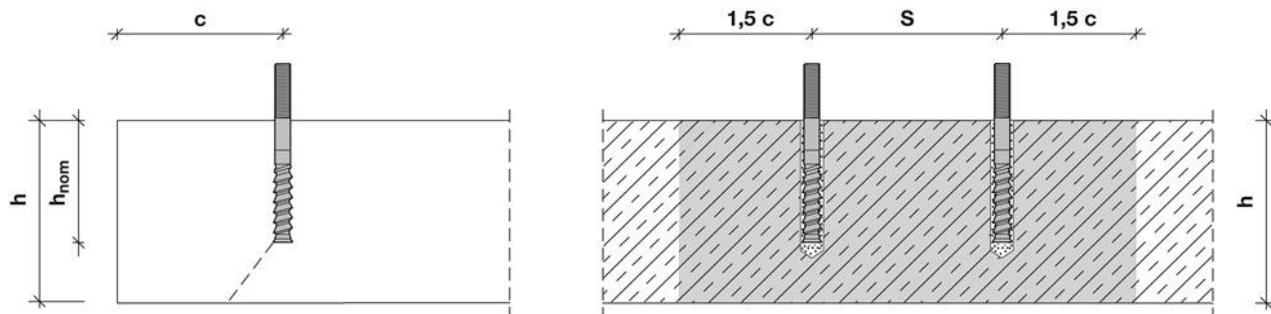

Member thickness $h \geq h_{nom} + 1,5 \cdot c$

Single anchor and group of anchors with $s > 3 \cdot c$ [mm²] $A_{i,cal} = (6 \cdot c) \cdot (h_{nom} + 1,5 \cdot c)$ with $c \geq 5 \cdot d$

Group of anchors with $s \leq 3 \cdot c$ [mm²] $A_{i,cal} = (3 \cdot c + s) \cdot (h_{nom} + 1,5 \cdot c)$ with $c \geq 5 \cdot d$ and $s \geq 5 \cdot d$

Member thickness $h \leq h_{nom} + 1,5 \cdot c$

Single anchor and group of anchors with $s > 3 \cdot c$ [mm²] $A_{i,cal} = (6 \cdot c) \cdot h$ with $c \geq 5 \cdot d$

Group of anchors with $s \leq 3 \cdot c$ [mm²] $A_{i,cal} = (3 \cdot c + s) \cdot h$ with $c \geq 5 \cdot d$ and $s \geq 5 \cdot d$

**Best case minimum edge distance and spacing

Corresponding spacing $s \geq$ [mm]	65	240	330	310	495

Minimum edge distance and spacing – Explanation

Minimum edge and spacing geometrical requirements are determined by testing the installation conditions in which two anchors with a given spacing can be set close to an edge without forming a crack in the concrete due to tightening torque.

The HIT-Z boundary conditions for edge and spacing geometry can be found in the tables to the left. If the embedment depth and slab thickness are equal to or greater than the values in the table, then the edge and spacing values may be utilized.

PROFIS Anchor software is programmed to calculate the referenced equations in order to determine the optimized related minimum edge and spacing based on the following variables:

Cracked or uncracked concrete

For cracked concrete it is assumed that a reinforcement is present which limits the crack width to 0,3 mm, allowing smaller values for minimum edge distance and minimum spacing

Anchor diameter

For smaller anchor diameter a smaller installation torque is required, allowing smaller values for minimum edge distance and minimum spacing

Slab thickness and embedment depth

Increasing these values allows smaller values for minimum edge distance and minimum spacing

Simplified design method

Simplified version of the design method according ETAG 001, TR 029. Design resistance according data given in ETA-12/0006 (HIT-HY 200-A) and ETA-12/0028 (HIT-HY 200-R) issued on 2013-03-15

- Influence of concrete strength
- Influence of edge distance
- Influence of spacing
- Valid for a group of two anchors. (The method may also be applied for anchor groups with more than two anchors or more than one edge distance. The influencing factors must then be considered for each edge distance and spacing. The simplified calculated design loads take a conservative approach: They will be lower than the exact values according to ETAG 001, TR 029. For an optimized design, anchor calculation can be performed using PROFIS anchor design software.)

The design method is based on the following simplification:

- No different loads are acting on individual anchors (no eccentricity)

The values are valid for one anchor.

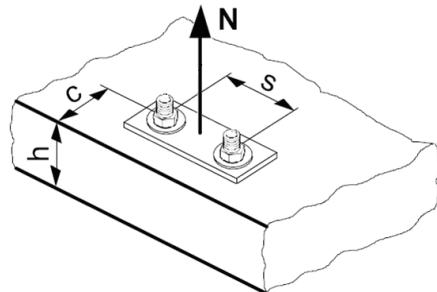

For more complex fastening applications please use the anchor design software PROFIS Anchor.

Tension loading

The design tensile resistance is the lower value of

- Steel resistance: $N_{Rd,s}$
- Combined pull-out and concrete cone resistance: $N_{Rd,p}$
- Concrete cone resistance: $N_{Rd,c}^0 = N_{Rd,c} \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,N} \cdot f_{re,N}$
- Concrete splitting resistance (only non-cracked concrete):

$$N_{Rd,sp} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,N} \cdot f_{re,N}$$

Basic design tensile resistance

Design steel resistance $N_{Rd,s}$

Anchor size	M8	M10	M12	M16	M20
$N_{Rd,s}$ HIT-Z / HIT-Z-R [kN]	16,0	25,3	36,7	64,0	97,3

Design combined pull-out and concrete cone resistance $N_{Rd,p}$ ^{a)}

Anchor size	M8	M10	M12	M16	M20
Non-cracked concrete					
$N_{Rd,p}^0$ Temperature range I [kN]	20,1	30,2	36,2	77,2	100,5
$N_{Rd,p}^0$ Temperature range II [kN]	18,4	27,6	33,2	70,8	92,2
$N_{Rd,p}^0$ Temperature range III [kN]	16,8	25,1	30,2	64,3	83,8
Cracked concrete					
$N_{Rd,p}^0$ Temperature range I [kN]	18,4	27,6	33,2	70,8	92,2
$N_{Rd,p}^0$ Temperature range II [kN]	16,8	25,1	30,2	64,3	83,8
$N_{Rd,p}^0$ Temperature range III [kN]	15,1	22,6	27,1	57,9	75,4

a) The combined pull-out and concrete cone resistance is independent from the embedment depth.

Design concrete cone resistance $N_{Rd,c} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,N} \cdot f_{re,N}$

Design splitting resistance ^{a)} $N_{Rd,sp} = N_{Rd,sp}^0 \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,N} \cdot f_{re,N}$

Anchor size	M8	M10	M12	M16	M20
$h_{nom,typ}$ [mm]	70	90	110	145	180
$N_{Rd,c}^0$ Non cracked concrete [kN]	19,7	28,7	38,8	58,8	81,3
$N_{Rd,c}^0$ Cracked concrete [kN]	14,1	20,5	27,7	41,9	58,0

a) Splitting resistance must only be considered for non-cracked concrete.

Influencing factors

Influence of concrete strength on combined pull-out and concrete cone resistance

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_{B,p} =$	1,00	1,00	1,00	1,00	1,00	1,00	1,00

Influence of concrete strength on concrete cone resistance

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25N/mm^2)^{0,5}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of edge distance ^{a)}

$c/c_{cr,N}$	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$c/c_{cr,sp}$										
$f_{1,N} = 0,7 + 0,3 \cdot c/c_{cr,N} \leq 1$	0,73	0,76	0,79	0,82	0,85	0,88	0,91	0,94	0,97	1
$f_{1,sp} = 0,7 + 0,3 \cdot c/c_{cr,sp} \leq 1$										
$f_{2,N} = 0,5 \cdot (1 + c/c_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{2,sp} = 0,5 \cdot (1 + c/c_{cr,sp}) \leq 1$										

a) The edge distance shall not be smaller than the minimum edge distance c_{min} . These influencing factors must be considered for every edge distance smaller than the critical edge distance.

Influence of anchor spacing ^{a)}

$s/s_{cr,N}$	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$s/s_{cr,sp}$										
$f_{3,N} = 0,5 \cdot (1 + s/s_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{3,sp} = 0,5 \cdot (1 + s/s_{cr,sp}) \leq 1$										

a) The anchor spacing shall not be smaller than the minimum anchor spacing s_{min} . This influencing factor must be considered for every anchor spacing.

Influence of embedment depth on concrete cone resistance

$$f_{h,N} = (h_{nom}/h_{nom,typ})^{1,5}$$

Influence of reinforcement

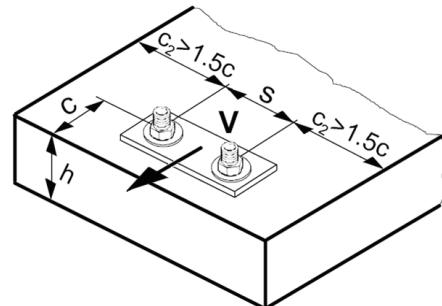

h_{nom} [mm]	60	70	80	90	≥ 100
$f_{re,N} = 0,5 + h_{nom}/200mm \leq 1$	0,8 ^{a)}	0,85 ^{a)}	0,9 ^{a)}	0,95 ^{a)}	1

a) This factor applies only for dense reinforcement. If in the area of anchorage there is reinforcement with a spacing ≥ 150 mm (any diameter) or with a diameter ≤ 10 mm and a spacing ≥ 100 mm, then a factor $f_{re,N} = 1$ may be applied.

Shear loading

The design shear resistance is the lower value of

- Steel resistance: $V_{Rd,s}$
- Concrete prout resistance: $V_{Rd,cp} = k \cdot \text{lower value of } N_{Rd,p} \text{ and } N_{Rd,c}$
- Concrete edge resistance: $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_B \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Basic design shear resistance

Design steel resistance $V_{Rd,s}$

Anchor size	M8	M10	M12	M16	M20
$V_{Rd,s}$ HIT-Z [kN]	9,6	15,2	21,6	38,4	58,4
$V_{Rd,s}$ HIT-Z-R [kN]	11,2	18,4	26,4	45,6	70,4

Design concrete prout resistance $V_{Rd,cp} = \text{lower value}^a) \text{ of } k \cdot N_{Rd,p} \text{ and } k \cdot N_{Rd,c}$

$k = 2$ for $h_{ef} \geq 60$ mm

a) $N_{Rd,p}$: Design combined pull-out and concrete cone resistance

$N_{Rd,c}$: Design concrete cone resistance

Design concrete edge resistance ^{a)} $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_B \cdot f_h \cdot f_4$

Anchor size	Non-cracked concrete					Cracked concrete				
	M8	M10	M12	M16	M20	M8	M10	M12	M16	M20
$V_{Rd,c}^0$ [kN]	5,8	8,6	11,6	18,9	27,4	4,1	6,0	8,2	13,3	19,4

a) For anchor groups only the anchors close to the edge must be considered.

Influencing factors

Influence of concrete strength

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25\text{N/mm}^2)^{1/2}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of angle between load applied and the direction perpendicular to the free edge

Angle β	0°	10°	20°	30°	40°	50°	60°	70°	80°	≥ 90°
$f_\beta = \sqrt{\frac{1}{(\cos \alpha_v)^2 + \left(\frac{\sin \alpha_v}{2,5}\right)^2}}$	1	1,01	1,05	1,13	1,24	1,40	1,64	1,97	2,32	2,50

Influence of base material thickness

h/c	0,15	0,3	0,45	0,6	0,75	0,9	1,05	1,2	1,35	≥ 1,5
$f_h = \{h/(1,5 \cdot c)\}^{1/2} \leq 1$	0,32	0,45	0,55	0,63	0,71	0,77	0,84	0,89	0,95	1,00

Influence of anchor spacing and edge distance ^{a)} for concrete edge resistance: f_4
 $f_4 = (c/h_{\text{nom}})^{1,5} \cdot (1 + s / [3 \cdot c]) \cdot 0,5$

a) The anchor spacing and the edge distance shall not be smaller than the minimum anchor spacing s_{\min} and the minimum edge distance c_{\min} .

Influence of embedment depth

h_{nom}/d	4	4,5	5	6	7	8	9	10	11
$f_{\text{hef}} = 0,05 \cdot (h_{\text{nom}} / d)^{1,68}$	0,51	0,63	0,75	1,01	1,31	1,64	2,00	2,39	2,81
h_{ef}/d	12	13	14	15	16	17	18	19	20
$f_{\text{hef}} = 0,05 \cdot (h_{\text{nom}} / d)^{1,68}$	3,25	3,72	4,21	4,73	5,27	5,84	6,42	7,04	7,67

Influence of edge distance ^{a)}

c/d	4	6	8	10	15	20	30	40
$f_c = (d / c)^{0,19}$	0,77	0,71	0,67	0,65	0,60	0,57	0,52	0,50

a) The edge distance shall not be smaller than the minimum edge distance c_{\min} .

Combined tension and shear loading

For combined tension and shear loading see section "Anchor Design".

Precalculated values – design resistance values

All data applies to:

- temperature range I (see service temperature range)
- no effects of dense reinforcement
- borehole condition 1

Recommended loads can be calculated by dividing the design resistance by an overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

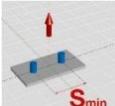

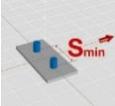

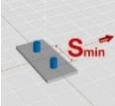

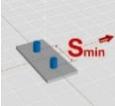

Design resistance: concrete C 20/25 – $f_{ck,cube} = 25 \text{ N/mm}^2$

Anchor size	M8	M10	M12	M16	M20

Seismic design C1 and C2

Basic loading data for concrete C20/25 – C50/60

All data in this section applies to:

- Seismic design according to TR045

The following technical data are based on: ETA-12/0006 and ETA-12/0028, issue 2013-03-15

Anchorage depth range

Anchor size	M8	M10	M12	M16	M20
Nominal anchorage depth range	$h_{\text{nom,min}}$ [mm]	60	60	60	96
	$h_{\text{nom,max}}$ [mm]	100	120	144	192
					220

Tension resistance in case of seismic performance category C1

Anchor size	M8	M10	M12	M16	M20
Characteristic tension resistance to steel failure					
HIT-Z / HIT-Z-R	$N_{Rk,s,\text{seis}}$ [kN]	24	38	55	96
Partial safety factor	$\gamma_{Ms,\text{seis}}$ [-]			1,5	
Characteristic bond resistance in cracked concrete C20/25 to C50/60					
Temperature range I: 24°C/40°C	$\tau_{Rk,\text{seis}}$ [N/mm ²]			21	
Temperature range II: 50°C/80°C	$\tau_{Rk,\text{seis}}$ [N/mm ²]			19	
Temperature range III: 72°C/120°C	$\tau_{Rk,\text{seis}}$ [N/mm ²]			17	
Partial safety factor	$\gamma_{Mp,\text{seis}}$ [-]			1,5	
Concrete cone resistance and splitting resistance					
Partial safety factor	$\gamma_{Mc,\text{seis}} = \gamma_{Msp,\text{seis}}$ [-]			1,5	

Displacement under tension load in case of seismic performance category C1 ¹⁾

Anchor size	M8	M10	M12	M16	M20
Displacement (HIT-Z / HIT-Z-R)	$\delta_{N,\text{seis}}$ [mm]	1,2	1,9	1,7	1,3

1) Maximum displacement during cycling (seismic event).

Shear resistance in case of seismic performance category C1 ¹⁾

Anchor size	M8	M10	M12	M16	M20
Characteristic shear resistance to steel failure					
HIT-Z	$V_{Rk,s,\text{seis}}$ [kN]	7	17	16	28
HIT-Z-R	$V_{Rk,s,\text{seis}}$ [kN]	8	19	22	31
Partial safety factor	$\gamma_{Ms,\text{seis}}$ [-]			1,25	
Concrete prout resistance and concrete edge resistance					
Partial safety factor	$\gamma_{Mcp,\text{seis}} = \gamma_{Mc,\text{seis}}$ [-]			1,5	

1) Reduction factor $\alpha_{gap} = 1,0$ when using the Hilti Dynamic Set

Displacement under shear load in case of seismic performance category C1 ¹⁾

Anchor size	M8	M10	M12	M16	M20
Displacement (HIT-Z)	$\delta_{V,\text{seis}}$ [mm]	4,0	5,0	4,9	4,3
Displacement (HIT-Z-R)	$\delta_{V,\text{seis}}$ [mm]	5,0	5,6	5,9	6,0

1) Maximum displacement during cycling (seismic event).

Tension resistance in case of seismic performance category C2

Anchor size	M12	M16
Characteristic tension resistance to steel failure		
HIT-Z / HIT-Z-R	$N_{Rk,s,seis}$ [kN]	55
Partial safety factor ¹⁾	$\gamma_{Ms,seis}$ [-]	1,5
Characteristic bond resistance in cracked concrete C20/25 to C50/60		
Temperature range I: 24°C/40°C	$\tau_{Rk,seis}$ [N/mm ²]	13
Temperature range II: 50°C/80°C	$\tau_{Rk,seis}$ [N/mm ²]	12
Temperature range III: 72°C/120°C	$\tau_{Rk,seis}$ [N/mm ²]	10
Partial safety factor	$\gamma_{Mp,seis}$ [-]	1,5
Concrete cone resistance and splitting resistance		
Partial safety factor	$\gamma_{Mc,seis} = \gamma_{Msp,seis}$ [-]	1,5

Displacement under tension load in case of seismic performance category C2

Anchor size	M12	M16
Displacement DLS (HIT-Z / HIT-Z-R)	$\delta_{N,seis}$ [mm]	1,3
Displacement ULS (HIT-Z / HIT-Z-R)	$\delta_{N,seis}$ [mm]	3,2

Shear resistance in case of seismic performance category C2¹⁾

Anchor size	M12	M16
Characteristic shear resistance to steel failure		
HIT-Z	$V_{Rk,s,seis}$ [kN]	11
HIT-Z-R	$V_{Rk,s,seis}$ [kN]	16

Description	Authority / Laboratory	No. / date of issue
European technical approval ^{a)}	DIBt, Berlin	ETA-11/0493 / 2013-06-20 (Hilti HIT-HY 200-A) ETA-12/0084 / 2013-06-20 (Hilti HIT-HY 200-R)
Fire test report	IBMB, Brunswick	3501/676/13 / 2012-08-03

a) All data given in this section according ETA-11/0493 and ETA-12/0084, issue 2013-06-20.

Basic loading data (for a single anchor)

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Steel failure
- Base material thickness, as specified in the table
- One typical embedment depth, as specified in the table
- One anchor material, as specified in the tables
- Concrete C 20/25, $f_{ck,cube} = 25 \text{ N/mm}^2$
- Temperate range I
(min. base material temperature -40°C, max. long term/short term base material temperature: +24°C/40°C)
- Installation temperature range -10°C to +40°C

For details see Simplified design method

Embedment depth ^{a)} and base material thickness for the basic loading data. Mean ultimate resistance, characteristic resistance, design resistance, recommended loads.

Anchor size	M8	M10	M12	M16	M20	M24	M27	M30
Typical embedment depth h_{ef} [mm]	80	90	110	125	170	210	240	270
Base material thickness h [mm]	110	120	140	165	220	270	300	340

a) The allowed range of embedment depth is shown in the setting details. The corresponding load values can be calculated according to the simplified design method.

a) With overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Service temperature range

Hilti HIT-HY 200 injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

Temperature range	Base material temperature	Maximum long term base material temperature	Maximum short term base material temperature
Temperature range I	-40 °C to +40 °C	+24 °C	+40 °C
Temperature range II	-40 °C to +80 °C	+50 °C	+80 °C
Temperature range III	-40 °C to +120 °C	+72 °C	+120 °C

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

Setting

Installation equipment

Anchor size	M8	M10	M12	M16	M20	M24	M27	M30
Rotary hammer	TE 2 – TE 16				TE 40 – TE 70			
Other tools, hammer drilling	compressed air gun or blow out pump, set of cleaning brushes, dispenser							

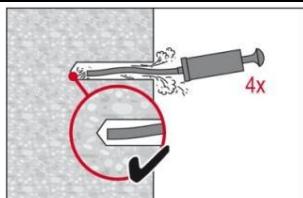

Setting instruction

Bore hole drilling	 <p>Drill Hole to the required embedment depth with a hammer drill set in rotation-hammer mode using an appropriately sized carbide drill bit.</p>

Bore hole cleaning Just before setting an anchor, the bore hole must be free of dust and debris.

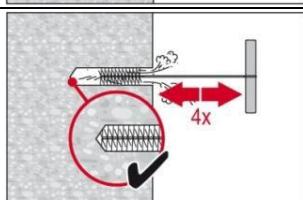

a) Manual Cleaning (MC) non-cracked concrete only

for bore hole diameters $d_0 \leq 20\text{mm}$ and bore hole depth $h_0 \leq 10d$

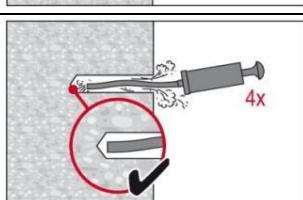

The Hilti manual pump may be used for blowing out bore holes up to diameters $d_0 \leq 20\text{ mm}$ and embedment depths up to $h_{ef} \leq 10d$.

Blow out at least 4 times from the back of the bore hole until return air stream is free of noticeable dust

Brush 4 times with the specified brush size by inserting the steel brush Hilti HIT-RB to the back of the hole (if needed with extension) in a twisting motion and removing it.

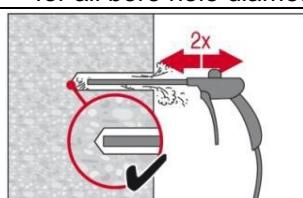

The brush must produce natural resistance as it enters the bore hole -- if not the brush is too small and must be replaced with the proper brush diameter.

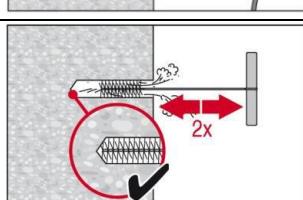

Blow out again with manual pump at least 4 times until return air stream is free of noticeable dust.

b) Compressed air cleaning (CAC)

for all bore hole diameters d_0 and all bore hole depth h_0

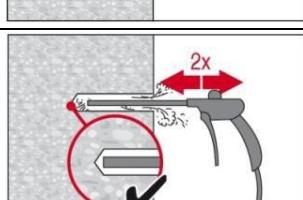

Blow 2 times from the back of the hole (if needed with nozzle extension) over the hole length with oil-free compressed air (min. 6 bar at 6 m³/h) until return air stream is free of noticeable dust. Bore hole diameter $\geq 32\text{ mm}$ the compressor must supply a minimum air flow of 140 m³/hour.

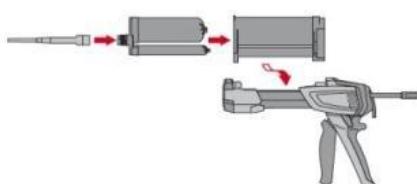

Brush 2 times with the specified brush size by inserting the steel brush Hilti HIT-RB to the back of the hole (if needed with extension) in a twisting motion and removing it.

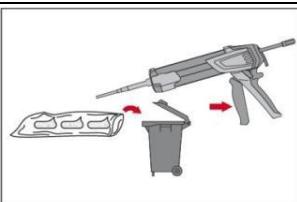

The brush must produce natural resistance as it enters the bore hole -- if not the brush is too small and must be replaced with the proper brush diameter.

Blow again with compressed air 2 times until return air stream is free of noticeable dust.

Injection preparation

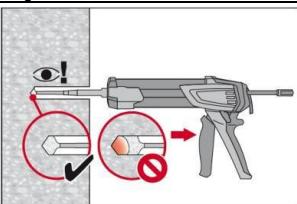

Tightly attach new Hilti mixing nozzle HIT-RE-M to foil pack manifold (snug fit). Do not modify the mixing nozzle. Observe the instruction for use of the dispenser. Check foil pack holder for proper function. Do not use damaged foil packs / holders. Swing foil pack holder with foil pack into HIT-dispenser.

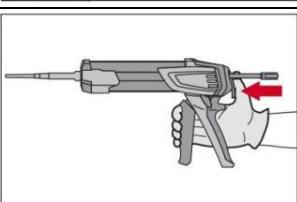

Discard initial adhesive. The foil pack opens automatically as dispensing is initiated. Depending on the size of the foil pack an initial amount of adhesive has to be discarded.

Discard quantities are:

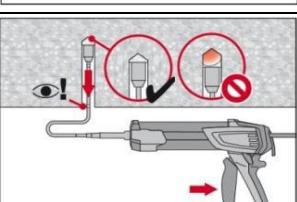

- 2 strokes for 330 ml foil pack,
- 3 strokes for 500 ml foil pack,
- 4 strokes for 500 ml foil pack $\leq 5^{\circ}\text{C}$.

Inject adhesive from the back of the borehole without forming air voids

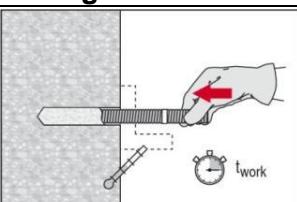

Inject the adhesive starting at the back of the hole, slowly withdrawing the mixer with each trigger pull. Fill holes approximately 2/3 full, or as required to ensure that the annular gap between the anchor and the concrete is completely filled with adhesive along the embedment length.

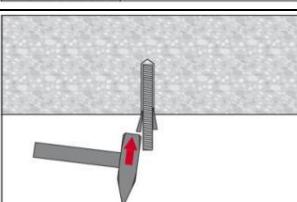

After injection is completed, depressurize the dispenser by pressing the release trigger. This will prevent further adhesive discharge from the mixer.

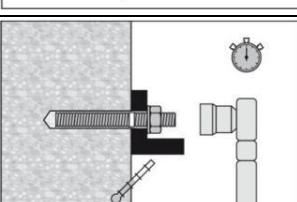

Overhead installation and/or installation with embedment depth $h_{\text{ef}} > 250\text{mm}$. For overhead installation the injection is only possible with the aid of extensions and piston plugs. Assemble HIT-RE-M mixer, extension(s) and appropriately sized piston plug. Insert piston plug to back of the hole and inject adhesive. During injection the piston plug will be naturally extruded out of the bore hole by the adhesive pressure.

Setting the element

Before use, verify that the element is dry and free of oil and other contaminants. Mark and set element to the required embedment depth until working time t_{work} has elapsed.

For overhead installation use piston plugs and fix embedded parts with e.g. wedges

Loading the anchor:
After required curing time t_{cure} the anchor can be loaded.
The applied installation torque shall not exceed T_{max} .

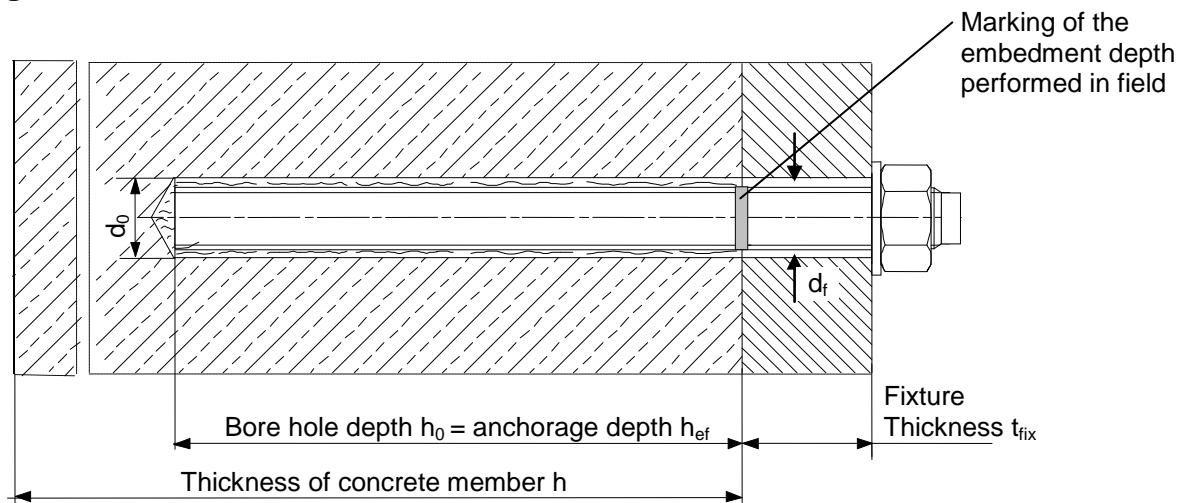

For detailed information on installation see instruction for use given with the package of the product.

Working time, curing time

Temperature of the base material	Hilti HIT-HY 200-R	
	Working time in which anchor can be inserted and adjusted t_{work}	Curing time before anchor can be loaded t_{cure}
-10 °C to -5 °C	3 hour	20 hour
-4 °C to 0 °C	2 hour	8 hour
1 °C to 5 °C	1 hour	4 hour
6 °C to 10 °C	40 min	2,5 hour
11 °C to 20 °C	15 min	1,5 hour
21 °C to 30 °C	9 min	1 hour
31 °C to 40 °C	6 min	1 hour

Temperature of the base material	Hilti HIT-HY 200-A	
	Working time in which anchor can be inserted and adjusted t_{work}	Curing time before anchor can be loaded t_{cure}
-10 °C to -5 °C	1,5 hour	7 hour
-4 °C to 0 °C	50 min	4 hour
1 °C to 5 °C	25 min	2 hour
6 °C to 10 °C	15 min	75 min
11 °C to 20 °C	7 min	45 min
21 °C to 30 °C	4 min	30 min
31 °C to 40 °C	3 min	30 min

Setting details

Setting details

Anchor size	M8	M10	M12	M16	M20	M24	M27	M30
Nominal diameter of drill bit d_0 [mm]	10	12	14	18	22	28	30	35
Effective embedment and drill hole depth range ^{a)} for HIT-V	$h_{ef,min}$ [mm] $h_{ef,max}$ [mm]	60 160	60 200	70 240	80 320	90 400	96 480	108 540
Minimum base material thickness h_{min} [mm]		$h_{ef} + 30 \text{ mm}$			$h_{ef} + 2 d_0$			
Diameter of clearance hole in the fixture d_f [mm]	9	12	14	18	22	26	30	33
Torque moment T_{max} ^{b)} [Nm]	10	20	40	80	150	200	270	300
Minimum spacing s_{min} [mm]	40	50	60	80	100	120	135	150
Minimum edge distance c_{min} [mm]	40	50	60	80	100	120	135	150
Critical spacing for splitting failure $s_{cr,sp}$ [mm]		$2 c_{cr,sp}$						
Critical edge distance for splitting failure ^{c)} $c_{cr,sp}$ [mm]		$1,0 \cdot h_{ef}$ for $h / h_{ef} \geq 2,0$ $4,6 h_{ef} - 1,8 h$ for $2,0 > h / h_{ef} > 1,3$ $2,26 h_{ef}$ for $h / h_{ef} \leq 1,3$						
Critical spacing for concrete cone failure $s_{cr,N}$ [mm]		$2 c_{cr,N}$						
Critical edge distance for concrete cone failure ^{d)} $c_{cr,N}$ [mm]		$1,5 h_{ef}$						

For spacing (or edge distance) smaller than critical spacing (or critical edge distance) the design loads have to be reduced.

- a) Embedment depth range: $h_{ef,min} \leq h_{ef} \leq h_{ef,max}$
- b) Maximum recommended torque moment to avoid splitting failure during installation with minimum spacing and/or edge distance.
- c) h : base material thickness ($h \geq h_{min}$), h_{ef} : embedment depth
- d) The critical edge distance for concrete cone failure depends on the embedment depth h_{ef} and the design bond resistance. The simplified formula given in this table is on the safe side.

Simplified design method

Simplified version of the design method according ETAG 001, TR 029. Design resistance according data given in ETA-11/0493 issued 2013-06-20 for HIT-HY 200-A and ETA-12/0084 issued 2013-06-20 for HIT-HY 200-R. Both mortars possess identical technical load performance.

- Influence of concrete strength
- Influence of edge distance
- Influence of spacing
- Valid for a group of two anchors. (The method may also be applied for anchor groups with more than two anchors or more than one edge distance. The influencing factors must then be considered for each edge distance and spacing. The simplified calculated design loads take a conservative approach: They will be lower than the exact values according to ETAG 001, TR 029. For an optimized design, anchor calculation can be performed using PROFIS anchor design software.)

The design method is based on the following simplification:

- No different loads are acting on individual anchors (no eccentricity)

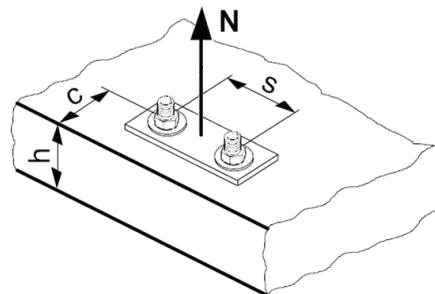

The values are valid for one anchor.

For more complex fastening applications please use the anchor design software PROFIS Anchor.

Tension loading

The design tensile resistance is the lower value of

- Steel resistance: $N_{Rd,s}$
- Combined pull-out and concrete cone resistance: $N_{Rd,p} = N^0_{Rd,p} \cdot f_{B,p} \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,p} \cdot f_{re,N}$
- Concrete cone resistance: $N_{Rd,c} = N^0_{Rd,c} \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,N} \cdot f_{re,N}$
- Concrete splitting resistance (only non-cracked concrete): $N_{Rd,sp} = N^0_{Rd,sp} \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,N} \cdot f_{re,N}$

Basic design tensile resistance

Design steel resistance $N_{Rd,s}$

Anchor size	M8	M10	M12	M16	M20	M24	M27	M30
$N_{Rd,s}$	HIT-V 5.8 [kN]	12,0	19,3	28,0	52,7	82,0	118,0	153,3
	HIT-V 8.8 [kN]	19,3	30,7	44,7	84,0	130,7	188,0	244,7
	HIT-V-R [kN]	13,9	21,9	31,6	58,8	92,0	132,1	80,4
	HIT-V-HCR [kN]	19,3	30,7	44,7	84,0	130,7	117,6	152,9

Design combined pull-out and concrete cone resistance

$$N_{Rd,p} = N_{Rd,p}^0 \cdot f_{B,p} \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,p} \cdot f_{re,N}$$

Anchor size	M8	M10	M12	M16	M20	M24	M27	M30
Typical embedment depth $h_{ef} = h_{ef,typ}$ [mm]	80	90	110	125	170	210	240	270
Non-cracked concrete								
$N_{Rd,p}^0$ Temperature range I [kN]	22,3	31,4	46,1	69,8	118,7	175,9	169,6	212,1
$N_{Rd,p}^0$ Temperature range II [kN]	19,0	26,7	39,2	59,3	100,9	149,5	135,7	169,6
$N_{Rd,p}^0$ Temperature range III [kN]	15,6	22,0	32,3	48,9	83,1	123,2	124,4	155,5
Cracked concrete								
$N_{Rd,p}^0$ Temperature range I [kN]	6,7	9,4	18,4	27,9	47,5	70,4	90,5	113,1
$N_{Rd,p}^0$ Temperature range II [kN]	5,0	7,1	15,0	22,7	38,6	57,2	73,5	91,9
$N_{Rd,p}^0$ Temperature range III [kN]	4,5	6,3	12,7	19,2	32,6	48,4	62,2	77,8

Design concrete cone resistance $N_{Rd,c} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,N} \cdot f_{re,N}$
Design splitting resistance a) $N_{Rd,sp} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,N} \cdot f_{re,N}$

Anchor size	M8	M10	M12	M16	M20	M24	M27	M30
$N_{Rd,c}^0$ Non-cracked concrete [kN]	20,1	24,0	32,4	39,2	62,2	85,4	104,3	124,5
$N_{Rd,c}^0$ Cracked concrete [kN]	14,3	17,1	23,1	28,0	44,3	60,9	74,4	88,7

a) Splitting resistance must only be considered for non-cracked concrete.

Influencing factors
Influence of concrete strength on combined pull-out and concrete cone resistance

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60

$f_{1,N} = 0,7 + 0,3 \cdot c/c_{cr,N} \leq 1$	0,73	0,76	0,79	0,82	0,85	0,88	0,91	0,94	0,97	1
$f_{1,sp} = 0,7 + 0,3 \cdot c/c_{cr,sp} \leq 1$										
$f_{2,N} = 0,5 \cdot (1 + c/c_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{2,sp} = 0,5 \cdot (1 + c/c_{cr,sp}) \leq 1$										

a) The edge distance shall not be smaller than the minimum edge distance c_{min} . These influencing factors must be considered for every edge distance smaller than the critical edge distance.

Influence of anchor spacing ^{a)}

$s/s_{cr,N}$	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$s/s_{cr,sp}$										
$f_{3,N} = 0,5 \cdot (1 + s/s_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{3,sp} = 0,5 \cdot (1 + s/s_{cr,sp}) \leq 1$										

- a) The anchor spacing shall not be smaller than the minimum anchor spacing s_{min} . This influencing factor must be considered for every anchor spacing.

Influence of embedment depth on concrete cone resistance

$$f_{h,N} = (h_{ef}/h_{ef,typ})^{1,5}$$

Influence of reinforcement

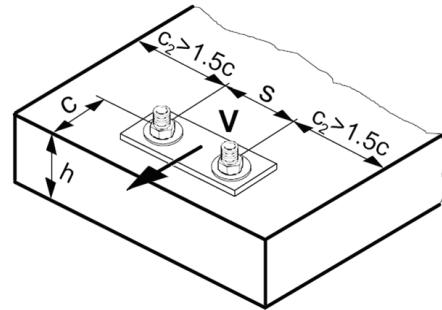

h_{ef} [mm]	60	70	80	90	≥ 100
$f_{re,N} = 0,5 + h_{ef}/200\text{mm} \leq 1$	0,8 a)	0,85 a)	0,9 a)	0,95 a)	1

- a) This factor applies only for dense reinforcement. If in the area of anchorage there is reinforcement with a spacing ≥ 150 mm (any diameter) or with a diameter ≤ 10 mm and a spacing ≥ 100 mm, then a factor $f_{re,N} = 1$ may be applied.

Shear loading

The design shear resistance is the lower value of

- Steel resistance: $V_{Rd,s}$
- Concrete prout resistance: $V_{Rd,cp} = k \cdot \text{lower value of } N_{Rd,p} \text{ and } N_{Rd,c}$
- Concrete edge resistance: $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_B \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Basic design shear resistance

Design steel resistance $V_{Rd,s}$

Anchor size	M8	M10	M12	M16	M20	M24	M27	M30	
$V_{Rd,s}$	HIT-V 5.8 [kN]	7,2	12,0	16,8	31,2	48,8	70,4	92,0	112,0
	HIT-V 8.8 [kN]	12,0	18,4	27,2	50,4	78,4	112,8	147,2	179,2
	HIT-V-R [kN]	8,3	12,8	19,2	35,3	55,1	79,5	48,3	58,8
	HIT-V-HCR [kN]	12,0	18,4	27,2	50,4	78,4	70,9	92,0	110,3

Design concrete prout resistance $V_{Rd,cp} = \text{lower value}^a) \text{ of } k \cdot N_{Rd,p} \text{ and } k \cdot N_{Rd,c}$

$$k = 2$$

- a) $N_{Rd,p}$: Design combined pull-out and concrete cone resistance, $N_{Rd,c}$: Design concrete cone resistance

Design concrete edge resistance $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_B \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Anchor size	M8	M10	M12	M16	M20	M24	M27	M30
Non-cracked concrete								
$V_{Rd,c}^0$ [kN]	5,9	8,6	11,6	18,7	27,0	36,6	44,5	53,0
Cracked concrete								
$V_{Rd,c}^0$ [kN]	4,2	6,1	8,2	13,2	19,2	25,9	31,5	37,5

Influencing factors

Influence of concrete strength

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25N/mm^2)^{1/2}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of angle between load applied and the direction perpendicular to the free edge

Angle β	0°	10°	20°	30°	40°	50°	60°	70°	80°	≥ 90°
$f_\beta = \sqrt{\frac{1}{(\cos \alpha_v)^2 + \left(\frac{\sin \alpha_v}{2,5}\right)^2}}$	1	1,01	1,05	1,13	1,24	1,40	1,64	1,97	2,32	2,50

Influence of base material thickness

h/c	0,15	0,3	0,45	0,6	0,75	0,9	1,05	1,2	1,35	≥ 1,5
$f_h = \{h/(1,5 \cdot c)\}^{1/2} \leq 1$	0,32	0,45	0,55	0,63	0,71	0,77	0,84	0,89	0,95	1,00

Influence of anchor spacing and edge distance a) for concrete edge resistance: f_4 $f_4 = (c/h_{ef})^{1,5} \cdot (1 + s / [3 \cdot c]) \cdot 0,5$

c/h _{ef}	Single anchor	Group of two anchors s/h _{ef}														
		0,75	1,50	2,25	3,00	3,75	4,50	5,25	6,00	6,75	7,50	8,25	9,00	9,75	10,50	11,25

a) The anchor spacing and the edge distance shall not be smaller than the minimum anchor spacing s_{min} and the minimum edge distance c_{min} .

Influence of embedment depth

h_{ef}/d	4	4,5	5	6	7	8	9	10	11
$f_{hef} = 0,05 \cdot (h_{ef} / d)^{1,68}$	0,51	0,63	0,75	1,01	1,31	1,64	2,00	2,39	2,81
h_{ef}/d	12	13	14	15	16	17	18	19	20
$f_{hef} = 0,05 \cdot (h_{ef} / d)^{1,68}$	3,25	3,72	4,21	4,73	5,27	5,84	6,42	7,04	7,67

Influence of edge distance ^{a)}

c/d	4	6	8	10	15	20	30	40
$f_c = (d / c)^{0,19}$	0,77	0,71	0,67	0,65	0,60	0,57	0,52	0,50

a) The edge distance shall not be smaller than the minimum edge distance c_{min} .

Combined tension and shear loading

For combined tension and shear loading see section “Anchor Design”.

Precalculated values – design resistance values

All data applies to:

- non-cracked concrete C 20/25 – $f_{ck,cube} = 25 \text{ N/mm}^2$
- temperature range I (see service temperature range)
- minimum thickness of base material
- no effects of dense reinforcement

Recommended loads can be calculated by dividing the design resistance by an overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Design resistance: concrete C 20/25 – $f_{ck,cube} = 25 \text{ N/mm}^2$ - minimum embedment depth

Description	Authority / Laboratory	No. / date of issue
European technical approval ^{a)}	DIBt, Berlin	ETA-11/0493 / 2013-06-20 (Hilti HIT-HY 200-A) ETA-12/0084 / 2013-06-08 (Hilti HIT-HY 200-R)

a) All data given in this section according ETA-11/0493 and ETA-12/0084, issue 2013-06-20.

Basic loading data (for a single anchor)

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Steel failure
- Base material thickness, as specified in the table
- One anchor material, as specified in the tables
- Concrete C 20/25, $f_{ck,cube} = 25 \text{ N/mm}^2$
- Temperate range I
(min. base material temperature -40°C, max. long term/short term base material temperature: +24°C/40°C)
- Installation temperature range -10°C to +40°C

For details see Simplified design method

Embedment depth and base material thickness for the basic loading data. Mean ultimate resistance, characteristic resistance, design resistance, recommended loads.

Anchor size	M8x90	M10x110	M12x125	M16x170	M20x205
Embedment depth h_{ef} [mm]	90	110	125	170	205
Base material thickness h [mm]	120	150	170	230	270

Mean ultimate resistance: concrete C 20/25 , anchor HIS-N with screw 8.8

Anchor size	M8x90	M10x110	M12x125	M16x170	M20x205

Shear V _{rec}	HIS-N [kN]	7,4	13,1	18,6	28,1	26,2

a) With overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Service temperature range

Hilti HIT-HY 200 injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

Temperature range	Base material temperature	Maximum long term base material temperature	Maximum short term base material temperature
Temperature range I	-40 °C to +40 °C	+24 °C	+40 °C
Temperature range II	-40 °C to +80 °C	+50 °C	+80 °C
Temperature range III	-40 °C to +120 °C	+72 °C	+120 °C

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

Materials**Mechanical properties of HIS-(R)N**

Embedment depth h_{ef} [mm]	90	110	125	170	205

Setting

Installation equipment

Anchor size	M8x90	M10x110	M12x125	M16x170	M20x205
Rotary hammer	TE 2 – TE 16			TE 40 – TE 70	
Other tools	compressed air gun or blow out pump, set of cleaning brushes, dispenser				

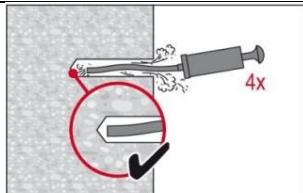

Setting instruction

Bore hole drilling	Drill hole to the required embedment depth with an appropriately sized Hilti TE-CD or TE-YD hollow drill bit with Hilti vacuum attachment. This drilling method properly cleans the borehole and removes dust while drilling. After drilling is complete, proceed to the "injection preparation" step in the instructions for use.
	Drill Hole to the required embedment depth with a hammer drill set in rotation-hammer mode using an appropriately sized carbide drill bit.

Bore hole cleaning Just before setting an anchor, the bore hole must be free of dust and debris.

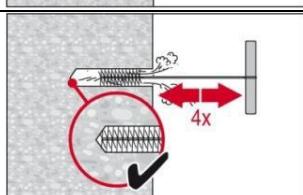

a) Manual Cleaning (MC) non-cracked concrete only

for bore hole diameters $d_0 \leq 20\text{mm}$ and bore hole depth $h_0 \leq 10\text{d}$

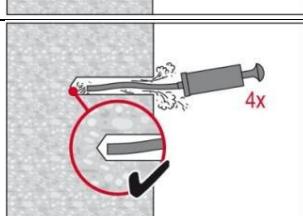

The Hilti manual pump may be used for blowing out bore holes up to diameters $d_0 \leq 20\text{ mm}$ and embedment depths up to $h_{ef} \leq 10d$.

Blow out at least 4 times from the back of the bore hole until return air stream is free of noticeable dust

Brush 4 times with the specified brush size by inserting the steel brush Hilti HIT-RB to the back of the hole (if needed with extension) in a twisting motion and removing it.

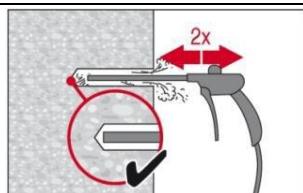

The brush must produce natural resistance as it enters the bore hole -- if not the brush is too small and must be replaced with the proper brush diameter.

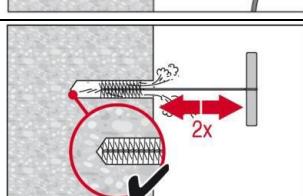

Blow out again with manual pump at least 4 times until return air stream is free of noticeable dust.

b) Compressed air cleaning (CAC)

for all bore hole diameters d_0 and all bore hole depth h_0

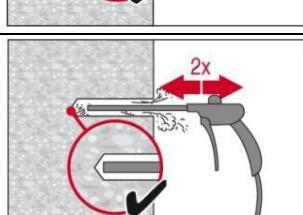

Blow 2 times from the back of the hole (if needed with nozzle extension) over the hole length with oil-free compressed air (min. 6 bar at 6 m³/h) until return air stream is free of noticeable dust.

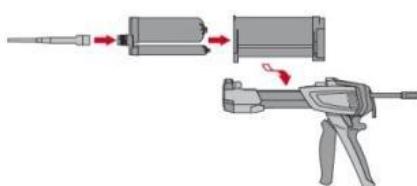

Brush 2 times with the specified brush size by inserting the steel brush Hilti HIT-RB to the back of the hole (if needed with extension) in a twisting motion and removing it.

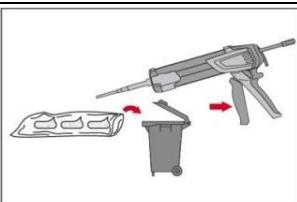

The brush must produce natural resistance as it enters the bore hole -- if not the brush is too small and must be replaced with the proper brush diameter.

Blow again with compressed air 2 times until return air stream is free of noticeable dust.

Injection preparation

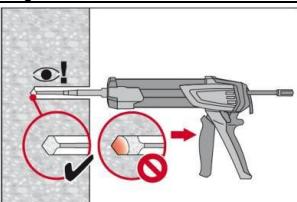

Tightly attach new Hilti mixing nozzle HIT-RE-M to foil pack manifold (snug fit). Do not modify the mixing nozzle. Observe the instruction for use of the dispenser. Check foil pack holder for proper function. Do not use damaged foil packs / holders. Swing foil pack holder with foil pack into HIT-dispenser.

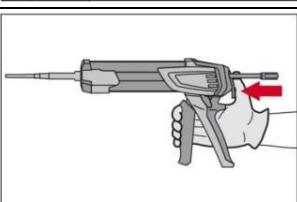

Discard initial adhesive. The foil pack opens automatically as dispensing is initiated. Depending on the size of the foil pack an initial amount of adhesive has to be discarded.

Discard quantities are:

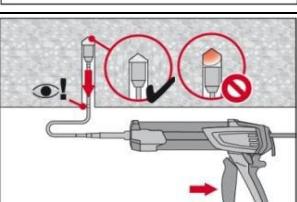

- 2 strokes for 330 ml foil pack,
- 3 strokes for 500 ml foil pack,
- 4 strokes for 500 ml foil pack $\leq 5^{\circ}\text{C}$.

Inject adhesive from the back of the borehole without forming air voids

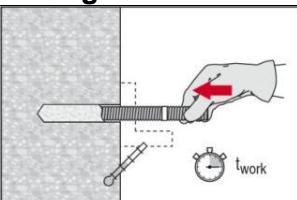

Inject the adhesive starting at the back of the hole, slowly withdrawing the mixer with each trigger pull. Fill holes approximately 2/3 full, or as required to ensure that the annular gap between the anchor and the concrete is completely filled with adhesive along the embedment length.

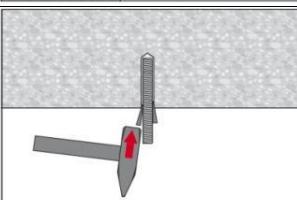

After injection is completed, depressurize the dispenser by pressing the release trigger. This will prevent further adhesive discharge from the mixer.

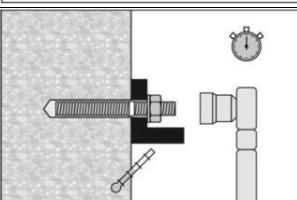

Overhead installation and/or installation with embedment depth $h_{\text{ef}} > 250\text{mm}$. For overhead installation the injection is only possible with the aid of extensions and piston plugs. Assemble HIT-RE-M mixer, extension(s) and appropriately sized piston plug. Insert piston plug to back of the hole and inject adhesive. During injection the piston plug will be naturally extruded out of the bore hole by the adhesive pressure.

Setting the element

Before use, verify that the element is dry and free of oil and other contaminants. Mark and set element to the required embedment depth until working time t_{work} has elapsed.

For overhead installation use piston plugs and fix embedded parts with e.g. wedges

Loading the anchor:
After required curing time t_{cure} the anchor can be loaded.
The applied installation torque shall not exceed T_{max} .

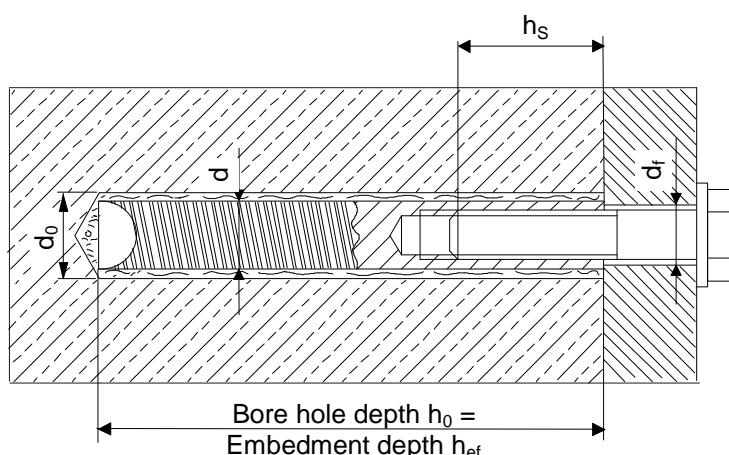

For detailed information on installation see instruction for use given with the package of the product.

Working time, curing time

Temperature of the base material	Hilti HIT-HY 200-R	
	Working time in which anchor can be inserted and adjusted t_{work}	Curing time before anchor can be fully loaded t_{cure}
-10 °C to -5 °C	3 hour	20 hour
-4 °C to 0 °C	2 hour	8 hour
1 °C to 5 °C	1 hour	4 hour
6 °C to 10 °C	40 min	2,5 hour
11 °C to 20 °C	15 min	1,5 hour
21 °C to 30 °C	9 min	1 hour
31 °C to 40 °C	6 min	1 hour

Temperature of the base material	Hilti HIT-HY 200-A	
	Working time in which anchor can be inserted and adjusted t_{work}	Curing time before anchor can be fully loaded t_{cure}
-10 °C to -5 °C	1,5 hour	7 hour
-4 °C to 0 °C	50 min	4 hour
1 °C to 5 °C	25 min	2 hour
6 °C to 10 °C	15 min	75 min
11 °C to 20 °C	7 min	45 min
21 °C to 30 °C	4 min	30 min
31 °C to 40 °C	3 min	30 min

Setting details

Anchor size	M8x90	M10x110	M12x125	M16x170	M20x205
Nominal diameter of drill bit d_0 [mm]	14	18	22	28	32
Diameter of element d [mm]	12,5	16,5	20,5	25,4	27,6
Effective anchorage and drill hole depth h_{ef} [mm]	90	110	125	170	205
Minimum base material thickness h_{min} [mm]	120	150	170	230	270
Diameter of clearance hole in the fixture d_f [mm]	9	12	14	18	22
Thread engagement length; min - max h_s [mm]	8-20	10-25	12-30	16-40	20-50
Torque moment ^{a)} T_{max} [Nm]	10	20	40	80	150
Minimum spacing s_{min} [mm]	40	45	55	65	90
Minimum edge distance c_{min} [mm]	40	45	55	65	90
Critical spacing for splitting failure $s_{\text{cr,sp}}$ [mm]	2 $c_{\text{cr,sp}}$				
Critical edge distance for splitting failure ^{b)} $c_{\text{cr,sp}}$ [mm]	$1,0 \cdot h_{\text{ef}}$ for $h / h_{\text{ef}} \geq 2,0$				
	$4,6 h_{\text{ef}} - 1,8 h$ for $2,0 > h / h_{\text{ef}} > 1,3$				
	$2,26 h_{\text{ef}}$ for $h / h_{\text{ef}} \leq 1,3$				
Critical spacing for concrete cone failure $s_{\text{cr,N}}$ [mm]	2 $c_{\text{cr,N}}$				
Critical edge distance for concrete cone failure ^{c)} $c_{\text{cr,N}}$ [mm]	1,5 h_{ef}				

For spacing (or edge distance) smaller than critical spacing (or critical edge distance) the design loads have to be reduced.

- a) Maximum recommended torque moment to avoid splitting failure during installation with minimum spacing and/or edge distance.
- b) h : base material thickness ($h \geq h_{\text{min}}$), h_{ef} : embedment depth
- c) The critical edge distance for concrete cone failure depends on the embedment depth h_{ef} and the design bond resistance. The simplified formula given in this table is on the safe side.

Simplified design method

Simplified version of the design method according ETAG 001, TR 029. Design resistance according data given in ETA-11/0493 issued 2013-06-20 for HIT-HY 200-A and ETA-12/0084 issued 2013-06-20 for HIT-HY 200-R. Both mortars possess identical technical load performance.

- Influence of concrete strength
- Influence of edge distance
- Influence of spacing
- Valid for a group of two anchors. (The method may also be applied for anchor groups with more than two anchors or more than one edge distance. The influencing factors must then be considered for each edge distance and spacing. The simplified calculated design loads take a conservative approach: They will be lower than the exact values according to ETAG 001, TR 029. For an optimized design, anchor calculation can be performed using PROFIS anchor design software.)

The design method is based on the following simplification:

- No different loads are acting on individual anchors (no eccentricity)

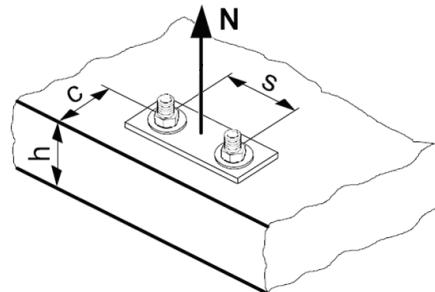

The values are valid for one anchor.

For more complex fastening applications please use the anchor design software PROFIS Anchor.

Tension loading

The design tensile resistance is the lower value of

- Steel resistance: $N_{Rd,s}$
- Combined pull-out and concrete cone resistance: $N_{Rd,p} = N^0_{Rd,p} \cdot f_{B,p} \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,p} \cdot f_{re,N}$
- Concrete cone resistance: $N_{Rd,c} = N^0_{Rd,c} \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,N} \cdot f_{re,N}$
- Concrete splitting resistance (only non-cracked concrete): $N_{Rd,sp} = N^0_{Rd,sp} \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,N} \cdot f_{re,N}$

Basic design tensile resistance

Design steel resistance $N_{Rd,s}$

Anchor size	M8x90	M10x110	M12x125	M16x170	M20x205
$N_{Rd,s}$ HIS-N with screw 8.8 [kN]	17,5	30,7	44,7	80,3	74,1
HIS-RN with screw A4-70	13,9	21,9	31,6	58,8	69,2

Design combined pull-out and concrete cone resistance

$$N_{Rd,p} = N_{Rd,p}^0 \cdot f_{B,p} \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,p} \cdot f_{re,N}$$

Anchor size	M8x90	M10x110	M12x125	M16x170	M20x205
Embedment depth h_{ef} [mm]	90	110	125	170	205
Non cracked concrete					
$N_{Rd,p}^0$ Temperature range I [kN]	30,6	49,4	69,8	117,6	154,7
$N_{Rd,p}^0$ Temperature range II [kN]	25,9	41,8	59,0	99,5	130,4
$N_{Rd,p}^0$ Temperature range III [kN]	22,4	36,1	51,0	85,9	112,6
Cracked concrete					
$N_{Rd,p}^0$ Temperature range I [kN]	16,5	26,6	37,6	63,3	83,0
$N_{Rd,p}^0$ Temperature range II [kN]	13,0	20,9	29,5	49,7	65,2
$N_{Rd,p}^0$ Temperature range III [kN]	11,8	19,0	26,8	45,2	59,3

Design concrete cone resistance $N_{Rd,c} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,N} \cdot f_{re,N}$
Design splitting resistance ^{a)} $N_{Rd,sp} = N_{Rd,sp}^0 \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,N} \cdot f_{re,N}$

Anchor size	M8	M10	M12	M16	M20
Non cracked concrete					
$N_{Rd,c}^0$ [kN]	28,7	38,8	47,1	74,6	98,8
Cracked concrete					
$N_{Rd,c}^0$ [kN]	20,5	27,7	33,5	53,2	70,4

a) Splitting resistance must only be considered for non-cracked concrete.

Influencing factors

Influence of concrete strength on combined pull-out and concrete cone resistance

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_{B,p} = (f_{ck,cube}/25N/mm^2)^{0,10}$ a)				$f_{B,p} = 1$			

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of embedment depth on combined pull-out and concrete cone resistance

$$f_{h,p} = 1$$

Influence of concrete strength on concrete cone resistance

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25N/mm^2)^{0,5}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of edge distance ^{a)}

$c/c_{cr,N}$	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$c/c_{cr,sp}$										
$f_{1,N} = 0,7 + 0,3 \cdot c/c_{cr,N} \leq 1$	0,73	0,76	0,79	0,82	0,85	0,88	0,91	0,94	0,97	1
$f_{1,sp} = 0,7 + 0,3 \cdot c/c_{cr,sp} \leq 1$										
$f_{2,N} = 0,5 \cdot (1 + c/c_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{2,sp} = 0,5 \cdot (1 + c/c_{cr,sp}) \leq 1$										

a) The edge distance shall not be smaller than the minimum edge distance c_{min} . These influencing factors must be considered for every edge distance smaller than the critical edge distance.

Influence of anchor spacing ^{a)}

$s/s_{cr,N}$	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$f_{3,N} = 0,5 \cdot (1 + s/s_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{3,sp} = 0,5 \cdot (1 + s/s_{cr,sp}) \leq 1$										

- a) The anchor spacing shall not be smaller than the minimum anchor spacing s_{min} . This influencing factor must be considered for every anchor spacing.

Influence of embedment depth on concrete cone resistance

$$f_{h,N} = 1$$

Influence of reinforcement

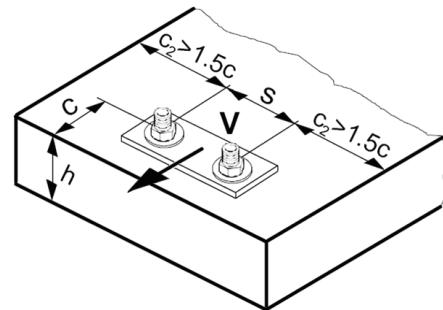

h_{ef} [mm]	40	50	60	70	80	90	≥ 100
$f_{re,N} = 0,5 + h_{ef}/200\text{mm} \leq 1$	0,7 ^{a)}	0,75 ^{a)}	0,8 ^{a)}	0,85 ^{a)}	0,9 ^{a)}	0,95 ^{a)}	1

- a) This factor applies only for dense reinforcement. If in the area of anchorage there is reinforcement with a spacing ≥ 150 mm (any diameter) or with a diameter ≤ 10 mm and a spacing ≥ 100 mm, then a factor $f_{re,N} = 1$ may be applied.

Shear loading

The design shear resistance is the lower value of

- Steel resistance: $V_{Rd,s}$
- Concrete prout resistance: $V_{Rd,cp} = k \cdot \text{lower value of } N_{Rd,p} \text{ and } N_{Rd,c}$
- Concrete edge resistance: $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_\beta \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Basic design shear resistance

Design steel resistance $V_{Rd,s}$

Anchor size	M8x90	M10x110	M12x125	M16x170	M20x205
HIS-N with screw 8.8 [kN]	10,4	18,4	26,0	39,3	36,7
$V_{Rd,s}$ HIS-RN with screw A4-70 [kN]	8,3	12,8	19,2	35,3	41,5

Design concrete prout resistance $V_{Rd,cp} = \text{lower value}^a)$ of $k \cdot N_{Rd,p}$ and $k \cdot N_{Rd,c}$

$$k = 2$$

- a) $N_{Rd,p}$: Design combined pull-out and concrete cone resistance
 $N_{Rd,c}$: Design concrete cone resistance

$$\text{Design concrete edge resistance } V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_\beta \cdot f_h \cdot f_4 \cdot f_{\text{hef}} \cdot f_c$$

Anchor size	M8	M10	M12	M16	M20
Non-cracked concrete					
$V_{Rd,c}^0$ [kN]	12,4	19,6	28,2	40,2	46,2
Cracked concrete					
$V_{Rd,c}^0$ [kN]	8,8	13,9	20,0	28,5	32,7

Influencing factors

Influence of concrete strength

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,\text{cube}}/25\text{N/mm}^2)^{1/2}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,\text{cube}}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of angle between load applied and the direction perpendicular to the free edge

Angle β	0°	10°	20°	30°	40°	50°	60°	70°	80°	≥ 90°
$f_\beta = \sqrt{\frac{1}{(\cos \alpha_v)^2 + \left(\frac{\sin \alpha_v}{2,5}\right)^2}}$	1	1,01	1,05	1,13	1,24	1,40	1,64	1,97	2,32	2,50

Influence of base material thickness

h/c	0,15	0,3	0,45	0,6	0,75	0,9	1,05	1,2	1,35	≥ 1,5
$f_h = \{h/(1,5 \cdot c)\}^{1/2} \leq 1$	0,32	0,45	0,55	0,63	0,71	0,77	0,84	0,89	0,95	1,00

Influence of anchor spacing and edge distance ^{a)} for concrete edge resistance: f_4

$$f_4 = (c/h_{\text{ef}})^{1,5} \cdot (1 + s / [3 \cdot c]) \cdot 0,5$$

c/h_{ef}	Single anchor	Group of two anchors s/h_{ef}														
		0,75	1,50	2,25	3,00	3,75	4,50	5,25	6,00	6,75	7,50	8,25	9,00	9,75	10,50	11,25

a) The anchor spacing and the edge distance shall not be smaller than the minimum anchor spacing s_{\min} and the minimum edge distance c_{\min} .

Influence of embedment depth

Anchor size	M8	M10	M12	M16	M20
$f_{\text{hef}} =$	1,38	1,21	1,04	1,22	1,45

Influence of edge distance ^{a)}

c/d	4	6	8	10	15	20	30	40
$f_c = (d / c)^{0,19}$	0,77	0,71	0,67	0,65	0,60	0,57	0,52	0,50

a) The edge distance shall not be smaller than the minimum edge distance c_{\min} .

Combined tension and shear loading

For combined tension and shear loading see section "Anchor Design".

Precalculated values – design resistance values

All data applies to:

- non-cracked concrete C 20/25 – $f_{ck,cube} = 25 \text{ N/mm}^2$
- temperature range I (see service temperature range)
- minimum thickness of base material
- no effects of dense reinforcement

Recommended loads can be calculated by dividing the design resistance by an overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Description	Authority / Laboratory	No. / date of issue
European technical approval ^{a)}	DIBt, Berlin	ETA-11/0493 / 2013-06-20 (Hilti HIT-HY 200-A) ETA-12/0084 / 2013-06-20 (Hilti HIT-HY 200-R)

a) All data given in this section according ETA-11/0493 and ETA-12/0084, issue 2013-06-20.

Basic loading data (for a single anchor)

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Steel failure
- Base material thickness, as specified in the table
- One typical embedment depth, as specified in the table
- One anchor material, as specified in the tables
- Concrete C 20/25, $f_{ck,cube} = 25 \text{ N/mm}^2$
- Temperate range I
(min. base material temperature -40°C, max. long term/short term base material temperature: +24°C/40°C)
- Installation temperature range +5°C to +40°C

For details see Simplified design method

Embedment depth ^{a)} and base material thickness for the basic loading data.

Mean ultimate resistance, characteristic resistance, design resistance, recommended loads.

Anchor size	Data according ETA-11/0493 and ETA-12/0084, issue 2013-06-20								
	Ø8	Ø10	Ø12	Ø14	Ø16	Ø20	Ø25	Ø28	Ø32
Typical embedment depth [mm]	80	90	110	125	145	170	210	270	300
Base material thickness [mm]	110	120	145	165	185	220	275	340	380

a) The allowed range of embedment depth is shown in the setting details. The corresponding load values can be calculated according to the simplified design method.

a) With overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Service temperature range

Hilti HIT-HY 200 injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

Temperature range	Base material temperature	Maximum long term base material temperature	Maximum short term base material temperature
Temperature range I	-40 °C to +40 °C	+24 °C	+40 °C
Temperature range II	-40 °C to +80 °C	+50 °C	+80 °C
Temperature range III	-40 °C to +120 °C	+72 °C	+120 °C

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

Setting

Installation equipment

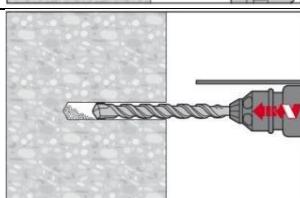

Anchor size	Ø8	Ø10	Ø12	Ø14	Ø16	Ø20	Ø25	Ø28	Ø32
Rotary hammer				TE 2 – TE 16					TE 40 – TE 70
Other tools	compressed air gun or blow out pump, set of cleaning brushes, dispenser								

Setting instruction

Bore hole drilling

Drill hole to the required embedment depth with an appropriately sized Hilti TE-CD or TE-YD hollow drill bit with Hilti vacuum attachment. This drilling method properly cleans the borehole and removes dust while drilling. After drilling is complete, proceed to the "injection preparation" step in the instructions for use.

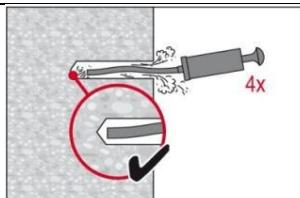

Drill Hole to the required embedment depth with a hammer drill set in rotation-hammer mode using an appropriately sized carbide drill bit.

Bore hole cleaning

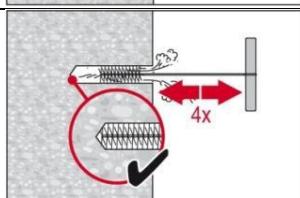

Just before setting an anchor, the bore hole must be free of dust and debris.

a) Manual Cleaning (MC) non-cracked concrete only

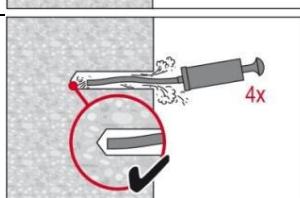

for bore hole diameters $d_0 \leq 20\text{mm}$ and bore hole depth $h_0 \leq 10d$

The Hilti manual pump may be used for blowing out bore holes up to diameters $d_0 \leq 20\text{ mm}$ and embedment depths up to $h_{ef} \leq 10d$. Blow out at least 4 times from the back of the bore hole until return air stream is free of noticeable dust

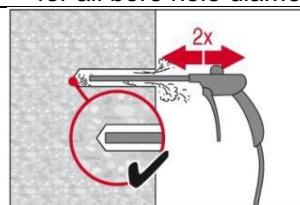

Brush 4 times with the specified brush size by inserting the steel brush Hilti HIT-RB to the back of the hole (if needed with extension) in a twisting motion and removing it. The brush must produce natural resistance as it enters the bore hole -- if not the brush is too small and must be replaced with the proper brush diameter.

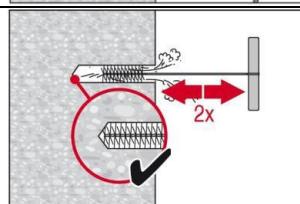

Blow out again with manual pump at least 4 times until return air stream is free of noticeable dust.

b) Compressed air cleaning (CAC)

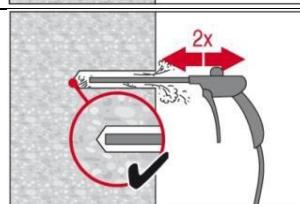

for all bore hole diameters d_0 and all bore hole depth h_0

Blow 2 times from the back of the hole (if needed with nozzle extension) over the hole length with oil-free compressed air (min. 6 bar at 6 m³/h) until return air stream is free of noticeable dust. Bore hole diameter ≥ 32 mm the compressor must supply a minimum air flow of 140 m³/hour.

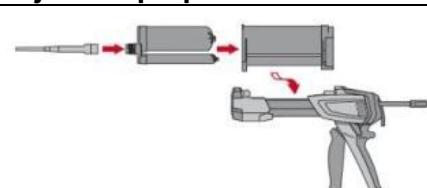

Brush 2 times with the specified brush size by inserting the steel brush Hilti HIT-RB to the back of the hole (if needed with extension) in a twisting motion and removing it.
The brush must produce natural resistance as it enters the bore hole -- if not the brush is too small and must be replaced with the proper brush diameter.

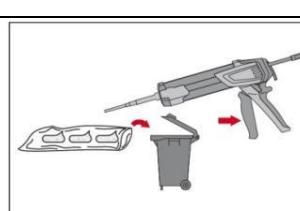

Blow again with compressed air 2 times until return air stream is free of noticeable dust.

Injection preparation

Tightly attach new Hilti mixing nozzle HIT-RE-M to foil pack manifold (snug fit). Do not modify the mixing nozzle. Observe the instruction for use of the dispenser. Check foil pack holder for proper function. Do not use damaged foil packs / holders. Swing foil pack holder with foil pack into HIT-dispenser.

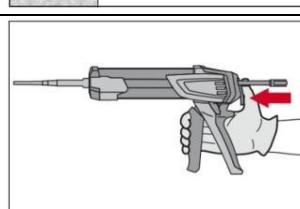

Discard initial adhesive. The foil pack opens automatically as dispensing is initiated. Depending on the size of the foil pack an initial amount of adhesive has to be discarded.
Discard quantities are:
2 strokes for 330 ml foil pack,
3 strokes for 500 ml foil pack,
4 strokes for 500 ml foil pack $\leq 5^\circ\text{C}$.

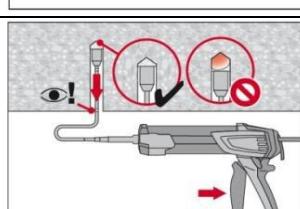

Inject adhesive from the back of the borehole without forming air voids

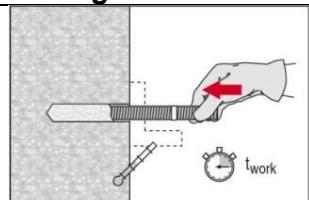

Inject the adhesive starting at the back of the hole, slowly withdrawing the mixer with each trigger pull. Fill holes approximately 2/3 full, or as required to ensure that the annular gap between the anchor and the concrete is completely filled with adhesive along the embedment length.

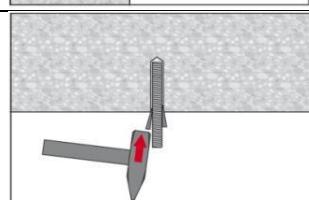

After injection is completed, depressurize the dispenser by pressing the release trigger. This will prevent further adhesive discharge from the mixer.

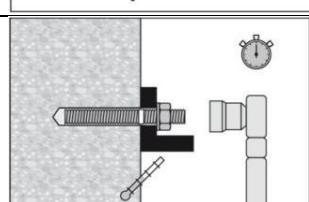

Overhead installation and/or installation with embedment depth $h_{ef} > 250$ mm. For overhead installation the injection is only possible with the aid of extensions and piston plugs. Assemble HIT-RE-M mixer, extension(s) and appropriately sized piston plug. Insert piston plug to back of the hole and inject adhesive. During injection the piston plug will be naturally extruded out of the bore hole by the adhesive pressure.

Setting the element

Before use, verify that the element is dry and free of oil and other contaminants.
Mark and set element to the required embedment depth until working time t_{work} has elapsed.

For overhead installation use piston plugs and fix embedded parts with e.g. wedges

Loading the anchor:
After required curing time t_{cure} the anchor can be loaded.
The applied installation torque shall not exceed T_{max} .

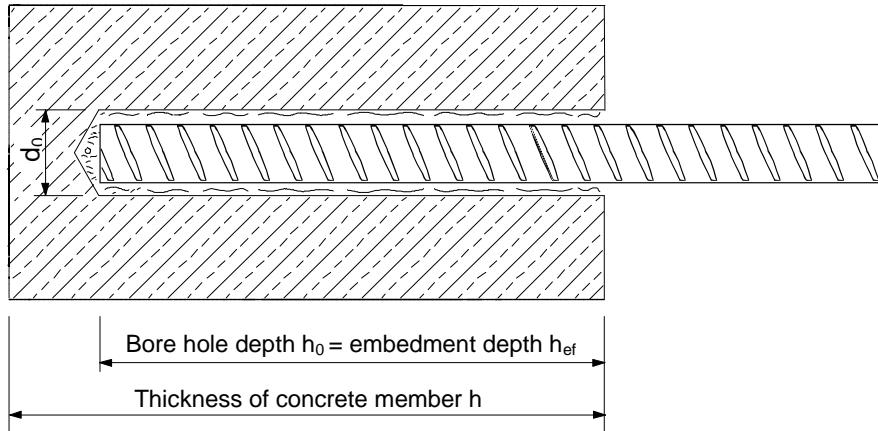

For detailed information on installation see instruction for use given with the package of the product.

Working time, curing time

Temperature of the base material	Hilti HIT-HY 200-R	
	Working time in which anchor can be inserted and adjusted t_{work}	Curing time before anchor can be loaded t_{cure}
-10 °C to -5 °C	3 hour	20 hour
-4 °C to 0 °C	2 hour	8 hour
1 °C to 5 °C	1 hour	4 hour
6 °C to 10 °C	40 min	2,5 hour
11 °C to 20 °C	15 min	1,5 hour
21 °C to 30 °C	9 min	1 hour
31 °C to 40 °C	6 min	1 hour

Temperature of the base material	Hilti HIT-HY 200-A	
	Working time in which anchor can be inserted and adjusted t_{work}	Curing time before anchor can be loaded t_{cure}
-10 °C to -5 °C	1,5 hour	7 hour
-4 °C to 0 °C	50 min	4 hour
1 °C to 5 °C	25 min	2 hour
6 °C to 10 °C	15 min	75 min
11 °C to 20 °C	7 min	45 min
21 °C to 30 °C	4 min	30 min
31 °C to 40 °C	3 min	30 min

Setting details

Setting details

		Data according ETA-11/0493 and ETA-12/0084, issue 2013-06-20								
Anchor size		Ø8	Ø10	Ø12	Ø14	Ø16	Ø20	Ø25	Ø28	Ø32
Nominal diameter of drill bit	d ₀ [mm]	12 (10) ^{a)}	14 (12) ^{a)}	16 (14) ^{a)}	18	20	25	32	35	40
Effective anchorage and drill hole depth range ^{b)}	h _{ef,min} [mm]	60	60	70	75	80	90	100	112	128
	h _{ef,max} [mm]	160	200	240	280	320	400	500	560	640
Minimum base material thickness	h _{min} [mm]	h _{ef} + 30 mm			h _{ef} + 2 d ₀					
Minimum spacing	s _{min} [mm]	40	50	60	70	80	100	125	140	160
Minimum edge distance	c _{min} [mm]	40	50	60	70	80	100	125	140	160
Critical spacing for splitting failure	s _{cr,sp}	2 c _{cr,sp}								
Critical edge distance for splitting failure ^{c)}	c _{cr,sp} [mm]	1,0 · h _{ef} for h / h _{ef} ≥ 2,0								
		4,6 h _{ef} - 1,8 h for 2,0 > h / h _{ef} > 1,3								
		2,26 h _{ef} for h / h _{ef} ≤ 1,3								
Critical spacing for concrete cone failure	s _{cr,N}	2 c _{cr,N}								
Critical edge distance for concrete cone failure ^{d)}	c _{cr,N}	1,5 h _{ef}								

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced.

- a) both given values for drill bit diameter can be used
- b) h_{ef,min} ≤ h_{ef} ≤ h_{ef,max} (h_{ef}: embedment depth)
- c) h: base material thickness (h ≥ h_{min})
- d) The critical edge distance for concrete cone failure depends on the embedment depth h_{ef} and the design bond resistance. The simplified formula given in this table is on the save side.

Simplified design method

Simplified version of the design method according ETAG 001, TR 029. Design resistance according data given in ETA-11/0493 issued 2013-06-20 for HIT-HY 200-A and ETA-12/0084 issued 2013-06-20 for HIT-HY 200-R. Both mortars possess identical technical load performance.

- Influence of concrete strength
- Influence of edge distance
- Influence of spacing
- Valid for a group of two anchors. (The method may also be applied for anchor groups with more than two anchors or more than one edge distance. The influencing factors must then be considered for each edge distance and spacing. The simplified calculated design loads take a conservative approach: They will be lower than the exact values according to ETAG 001, TR 029. For an optimized design, anchor calculation can be performed using PROFIS anchor design software.)

The design method is based on the following simplification:

- No different loads are acting on individual anchors (no eccentricity)

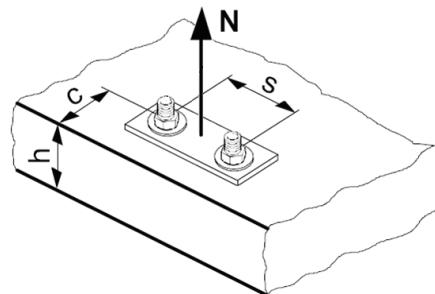

The values are valid for one anchor.

For more complex fastening applications please use the anchor design software PROFIS Anchor.

Tension loading

The design tensile resistance is the lower value of

- Steel resistance: $N_{Rd,s}$
- Combined pull-out and concrete cone resistance: $N_{Rd,p} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,p} \cdot f_{re,N}$
- Concrete cone resistance: $N_{Rd,c} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,N} \cdot f_{re,N}$
- Concrete splitting resistance (only non-cracked concrete): $N_{Rd,sp} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,N} \cdot f_{re,N}$

$f_{1,sp} = 0,7 + 0,3 \cdot c/c_{cr,sp}$										
$f_{2,N} = 0,5 \cdot (1 + c/c_{cr,N})$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{2,sp} = 0,5 \cdot (1 + c/c_{cr,sp})$										

- a) The the edge distance shall not be smaller than the minimum edge distance c_{min} given in the table with the setting details. These influencing factors must be considered for every edge distance smaller than the critical edge distance.

Influence of anchor spacing ^{a)}

$s/s_{cr,N}$	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$s/s_{cr,sp}$										
$f_{3,N} = 0,5 \cdot (1 + s/s_{cr,N})$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{3,sp} = 0,5 \cdot (1 + s/s_{cr,sp})$										

- a) The anchor spacing shall not be smaller than the minimum anchor spacing s_{min} given in the table with the setting details. This influencing factor must be considered for every anchor spacing.

Influence of embedment depth on concrete cone resistance

$$f_{h,N} = (h_{ef}/h_{ef,typ})^{1,5}$$

Influence of reinforcement

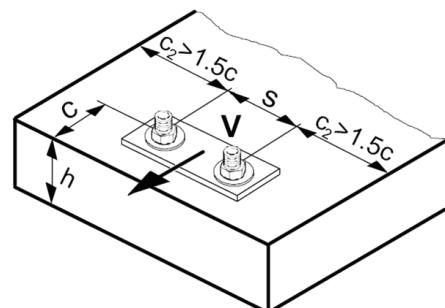

h_{ef} [mm]	60	70	80	90	≥ 100
$f_{re,N} = 0,5 + h_{ef}/200\text{mm} \leq 1$	0,8 ^{a)}	0,85 ^{a)}	0,9 ^{a)}	0,95 ^{a)}	1

- a) This factor applies only for dense reinforcement. If in the area of anchorage there is reinforcement with a spacing ≥ 150 mm (any diameter) or with a diameter ≤ 10 mm and a spacing ≥ 100 mm, then a factor $f_{re} = 1$ may be applied.

Shear loading

The design shear resistance is the lower value of

- Steel resistance: $V_{Rd,s}$
- Concrete prout resistance: $V_{Rd,cp} = k \cdot \text{lower value of } N_{Rd,p} \text{ and } N_{Rd,c}$
- Concrete edge resistance: $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_B \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Basic design shear resistance

Design steel resistance $V_{Rd,s}$

		Data according ETA-11/0493 and ETA-12/0084, issue 2013-06-20									
Anchor size		Ø8	Ø10	Ø12	Ø14	Ø16	Ø20	Ø25	Ø28	Ø32	
$V_{Rd,s}$	BSt 500 S	[kN]	9,3	14,7	20,7	28,0	36,7	57,3	90,0	112,7	147,3

Design concrete prout resistance $V_{Rd,cp}$ = lower value^{a)} of $k \cdot N_{Rd,p}$ and $k \cdot N_{Rd,c}$

$$k = 2$$

- a) $N_{Rd,p}$: Design combined pull-out and concrete cone resistance
 $N_{Rd,c}$: Design concrete cone resistance

Design concrete edge resistance $V_{Rd,c}$ = $V_{Rd,c}^0 \cdot f_B \cdot f_\beta \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Anchor size	Data according ETA-11/0493 and ETA-12/0084, issue 2013-06-20

a) The anchor spacing and the edge distance shall not be smaller than the minimum anchor spacing s_{\min} and the minimum edge distance c_{\min} .

Influence of embedment depth

h_{ef}/d	4	4,5	5	6	7	8	9	10	11
$f_{\text{hef}} = 0,05 \cdot (h_{\text{ef}} / d)^{1,68}$	0,51	0,63	0,75	1,01	1,31	1,64	2,00	2,39	2,81
h_{ef}/d	12	13	14	15	16	17	18	19	20
$f_{\text{hef}} = 0,05 \cdot (h_{\text{ef}} / d)^{1,68}$	3,25	3,72	4,21	4,73	5,27	5,84	6,42	7,04	7,67

Influence of edge distance ^{a)}

c/d	4	6	8	10	15	20	30	40
$f_c = (d / c)^{0,19}$	0,77	0,71	0,67	0,65	0,60	0,57	0,52	0,50

a) The edge distance shall not be smaller than the minimum edge distance c_{\min} .

Combined tension and shear loading

For combined tension and shear loading see section "Anchor Design".

Precalculated values

Recommended loads can be calculated by dividing the design resistance by an overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Design resistance: concrete C 20/25 – $f_{ck,cube} = 25 \text{ N/mm}^2$, Temperature range I

Description	Authority / Laboratory	No. / date of issue
European Technical Approval ^{a)}	DIBt, Berlin	ETA-08/0341 / 2013-03-18

a) All data given in this section according ETA-08/0341 issue 2013-03-18.

Basic loading data (for a single anchor)

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Steel failure
- Base material thickness, as specified in the table
- One typical embedment depth, as specified in the table
- One anchor material, as specified in the tables
- Concrete C 20/25, $f_{ck,cube} = 25$ N/mm²
- Temperate range I
(min. base material temperature -40°C, max. long term/short term base material temperature: +24°C/40°C)
- Installation temperature range -5°C to +40°C

For details see Simplified design method

**Embedment depth^{a)} and base material thickness for the basic loading data.
 Mean ultimate resistance, characteristic resistance, design resistance, recommended loads.**

Anchor size	M8	M10	M12	M16	M20	M24	M27	M30
Typical embedment depth h_{ef} [mm]	80	90	110	125	170	210	240	270
Base material thickness h [mm]	110	120	140	165	220	270	300	340

a) The allowed range of embedment depth is shown in the setting details. The corresponding load values can be calculated according to the simplified design method.

Mean ultimate resistance: non-cracked concrete C 20/25 , anchor HIT-V 5.8

Anchor size	M8	M10	M12	M16	M20	M24	M27	M30
Tensile $N_{Ru,m}$ HIT-V 5.8 [kN]	18,9	30,5	44,1	75,4	121,1	168,9	203,6	237,5
Shear $V_{Ru,m}$ HIT-V 5.8 [kN]	9,5	15,8	22,1	41,0	64,1	92,4	120,8	147,0

Characteristic resistance: non-cracked concrete C 20/25 , anchor HIT-V 5.8

Anchor size	M8	M10	M12	M16	M20	M24	M27	M30
Tensile N_{Rk} HIT-V 5.8 [kN]	18,0	29,0	42,0	56,5	90,8	126,7	152,7	178,1
Shear V_{Rk} HIT-V 5.8 [kN]	9,0	15,0	21,0	39,0	61,0	88,0	115,0	140,0

Design resistance: non-cracked concrete C 20/25 , anchor HIT-V 5.8

Tensile N_{Rd} HIT-V 5.8 [kN]	12,0	17,3	25,3	26,9	43,2	60,3	72,7	84,8
Shear V_{Rd} HIT-V 5.8 [kN]	7,2	12,0	16,8	31,2	48,8	70,4	92,0	112,0

Recommended loads^{a)}: non-cracked concrete C 20/25 , anchor HIT-V 5.8

Anchor size	M8	M10	M12	M16	M20	M24	M27	M30
Tensile N_{rec} HIT-V 5.8 [kN]	8,6	12,3	18,1	19,2	30,9	43,1	51,9	60,6
Shear V_{rec} HIT-V 5.8 [kN]	5,1	8,6	12,0	22,3	34,9	50,3	65,7	80,0

a) With overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Service temperature range

Hilti HIT-HY 110 injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

Temperature range	Base material temperature	Maximum long term base material temperature	Maximum short term base material temperature
Temperature range I	-40 °C to +40 °C	+24 °C	+40 °C
Temperature range II	-40 °C to +80 °C	+50 °C	+80 °C
Temperature range III	-40 °C to +120 °C	+72 °C	+120 °C

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

Materials

Mechanical properties of HIT-V / HAS

Anchor size		M8	M10	M12	M16	M20	M24	M27	M30

Embedment depth h_{ef} [mm]	80	90	110	125	170	210	240	270
Anchor rod HIT-V, HIT-V-R, HIT-V-HCR	Anchor rods HIT-V (-R / -HCR) are available in variable length							

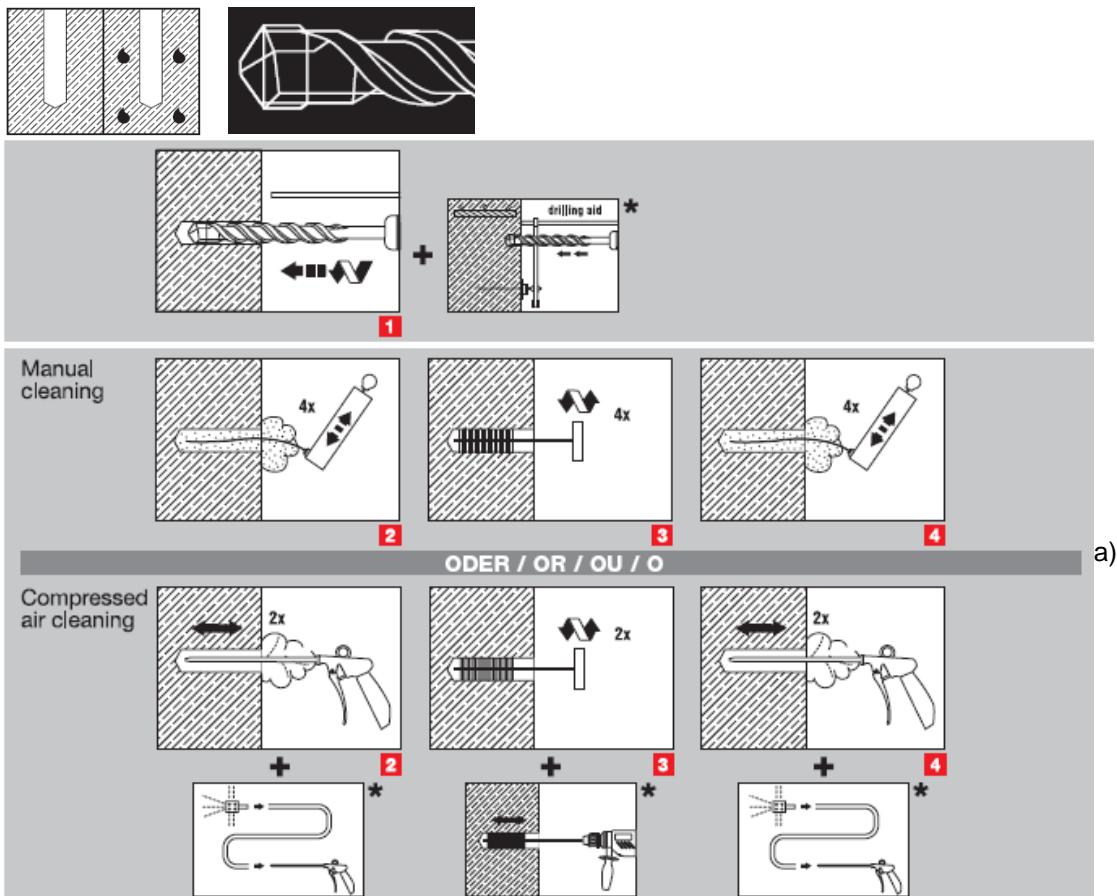

Setting

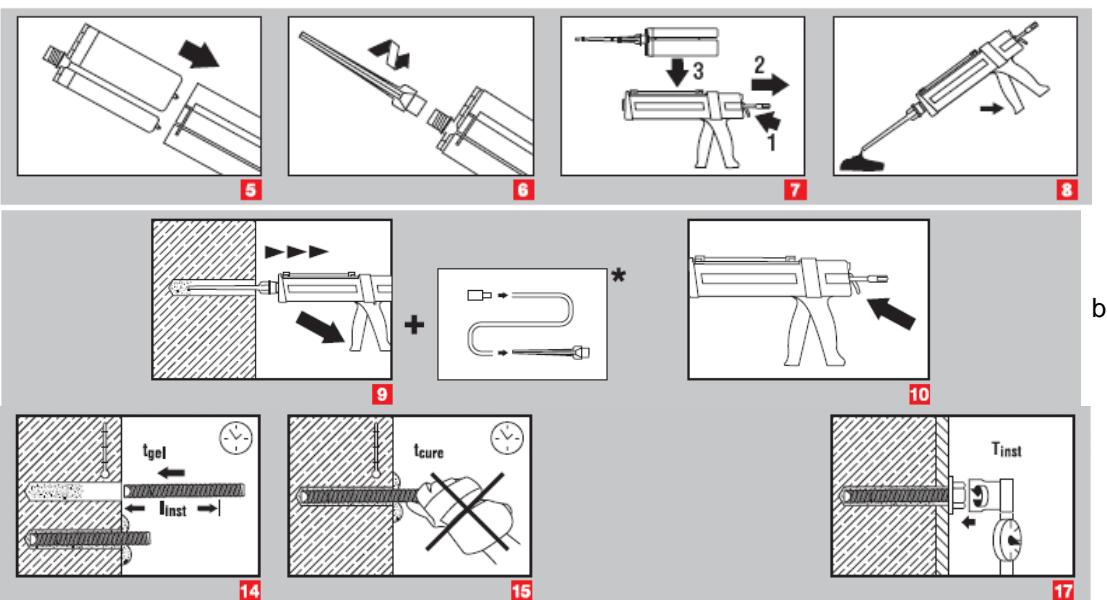

Installation equipment

Anchor size	M8	M10	M12	M16	M20	M24	M27	M30
Rotary hammer			TE 2 – TE 30					TE 40 – TE 70
Other tools	compressed air gun or blow out pump, set of cleaning brushes, dispenser							

Setting instruction

Dry and water-saturated concrete, hammer drilling

a) Note: Manual cleaning for drill hole sizes $d_0 \leq 18\text{mm}$ and embedment depth $h_{ef} \leq 10\text{ d}$ only!

Compressed air cleaning for all bore hole diameters and all bore hole depth

b) Note: Extension and piston plug needed for overhead installation and/or embedment depth > 250mm!

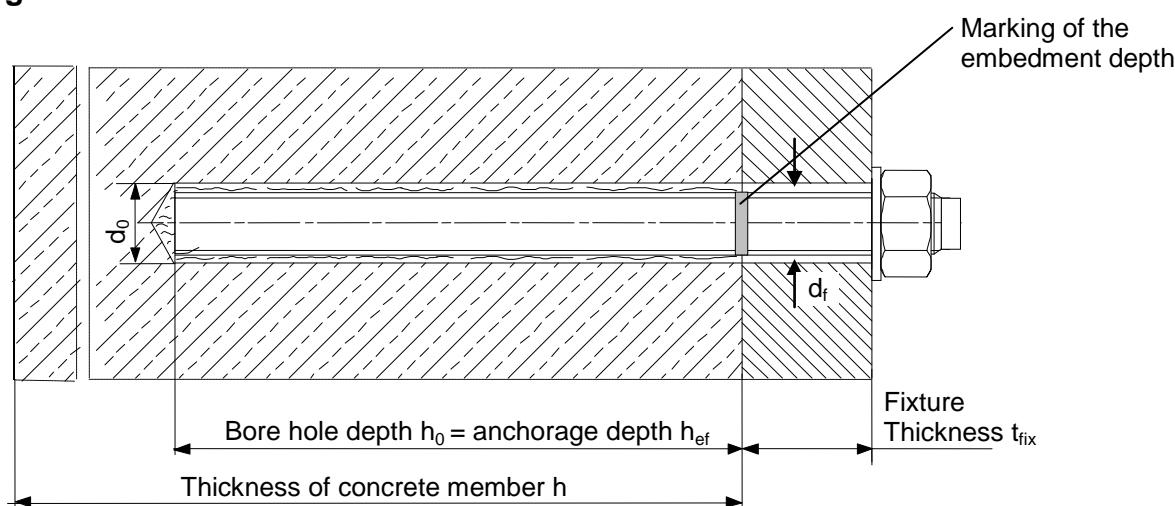

For detailed information on installation see instruction for use given with the package of the product.

Working time, Curing time

Temperature of the base material T_{BM}	Working time t_{gel}	Curing time t_{cure} ^{a)}
-5 °C to -1 °C	90 min	9 h
0 °C to 4 °C	45 min	4,5 h
5 °C to 9 °C	20 min	2 h
10 °C to 19 °C	6 min	90 min
20 °C to 29 °C	4 min	50 min
30 °C to 40 °C	2 min	40 min

a) The curing time data are valid for dry anchorage base only. For water saturated anchorage bases the curing times must be doubled.

Setting details

Setting details

Anchor size	M8	M10	M12	M16	M20	M24	M27	M30		
Nominal diameter of drill bit d_0 [mm]	10	12	14	18	22	28	30	35		
Effective embedment and drill hole depth range ^{a)} for HIT-V	$h_{ef,min}$ [mm] $h_{ef,max}$ [mm]	60 160	60 200	70 240	80 320	90 400	100 480	110 540		
Effective anchorage and drill hole depth for HAS	h_{ef} [mm]	80	90	110	125	170	210	240		
Minimum base material thickness h_{min} [mm]	$h_{ef} + 30 \text{ mm}$ $\geq 100 \text{ mm}$			$h_{ef} + 2 d_0$						
Diameter of clearance hole in the fixture d_f [mm]	9	12	14	18	22	26	30	33		
Torque moment T_{max} ^{b)} [Nm]	10	20	40	80	150	200	270	300		
Minimum spacing s_{min} [mm]	40	50	60	80	100	120	135	150		
Minimum edge distance c_{min} [mm]	40	50	60	80	100	120	135	150		
Critical spacing for splitting failure $s_{cr,sp}$ [mm]	$2 c_{cr,sp}$									
Critical edge distance for splitting failure ^{c)} $c_{cr,sp}$ [mm]	$1,0 \cdot h_{ef}$ for $h / h_{ef} \geq 2,0$ $4,6 h_{ef} - 1,8 h$ for $2,0 > h / h_{ef} > 1,3$ $2,26 h_{ef}$ for $h / h_{ef} \leq 1,3$									
Critical spacing for concrete cone failure $s_{cr,N}$ [mm]	$2 c_{cr,N}$									
Critical edge distance for concrete cone failure ^{d)} $c_{cr,N}$ [mm]	$1,5 h_{ef}$									

For spacing (or edge distance) smaller than critical spacing (or critical edge distance) the design loads have to be reduced.

- a) Embedment depth range: $h_{ef,min} \leq h_{ef} \leq h_{ef,max}$
- b) Maximum recommended torque moment to avoid splitting failure during installation with minimum spacing and/or edge distance.
- c) h: base material thickness ($h \geq h_{min}$), h_{ef} : embedment depth
- d) The critical edge distance for concrete cone failure depends on the embedment depth h_{ef} and the design bond resistance. The simplified formula given in this table is on the save side.

Simplified design method

Simplified version of the design method according ETAG 001, TR 029.

- Influence of concrete strength
- Influence of edge distance
- Influence of spacing
- Valid for a group of two anchors. (The method may also be applied for anchor groups with more than two anchors or more than one edge distance. The influencing factors must then be considered for each edge distance and spacing. The calculated design loads are then on the save side: They will be lower than the exact values according ETAG 001, TR 029. To avoid this, it is recommended to use the anchor design software PROFIS anchor)

The design method is based on the following simplification:

- No different loads are acting on individual anchors (no eccentricity)

The values are valid for one anchor.

For more complex fastening applications please use the anchor design software PROFIS Anchor.

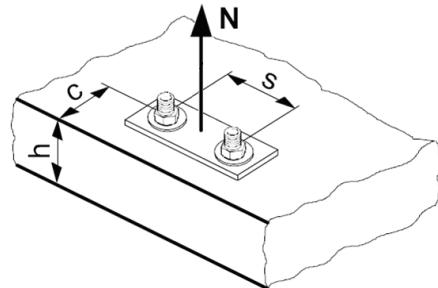

Tension loading

The design tensile resistance is the lower value of

- Steel resistance: $N_{Rd,s}$
- Combined pull-out and concrete cone resistance:

$$N_{Rd,p} = N_{Rd,c}^0 \cdot f_{B,p} \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,p} \cdot f_{re,N}$$
- Concrete cone resistance: $N_{Rd,c} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,N} \cdot f_{re,N}$
- Concrete splitting resistance (only non-cracked concrete):

$$N_{Rd,sp} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,N} \cdot f_{re,N}$$

Basic design tensile resistance

Design steel resistance $N_{Rd,s}$

Anchor size	M8	M10	M12	M16	M20	M24	M27	M30

$c/c_{cr,N}$	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$c/c_{cr,sp}$										
$f_{1,N} = 0,7 + 0,3 \cdot c/c_{cr,N} \leq 1$	0,73	0,76	0,79	0,82	0,85	0,88	0,91	0,94	0,97	1
$f_{1,sp} = 0,7 + 0,3 \cdot c/c_{cr,sp} \leq 1$										
$f_{2,N} = 0,5 \cdot (1 + c/c_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{2,sp} = 0,5 \cdot (1 + c/c_{cr,sp}) \leq 1$										

a) The edge distance shall not be smaller than the minimum edge distance c_{min} . These influencing factors must be considered for every edge distance smaller than the critical edge distance.

Influence of anchor spacing a)

$s/s_{cr,N}$	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$s/s_{cr,sp}$										
$f_{3,N} = 0,5 \cdot (1 + s/s_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{3,sp} = 0,5 \cdot (1 + s/s_{cr,sp}) \leq 1$										

a) The anchor spacing shall not be smaller than the minimum anchor spacing s_{min} . This influencing factor must be considered for every anchor spacing.

Influence of embedment depth on concrete cone resistance

$$f_{h,N} = (h_{ef}/h_{ef,typ})^{1,5}$$

Influence of reinforcement

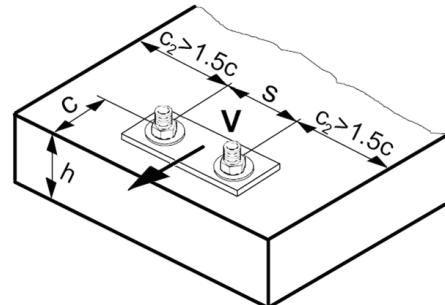

h_{ef} [mm]	40	50	60	70	80	90	≥ 100
$f_{re,N} = 0,5 + h_{ef}/200\text{mm} \leq 1$	0,7 a)	0,75 a)	0,8 a)	0,85 a)	0,9 a)	0,95 a)	1

a) This factor applies only for dense reinforcement. If in the area of anchorage there is reinforcement with a spacing ≥ 150 mm (any diameter) or with a diameter ≤ 10 mm and a spacing ≥ 100 mm, then a factor $f_{re,N} = 1$ may be applied.

Shear loading

The design shear resistance is the lower value of

- Steel resistance: $V_{Rd,s}$
- Concrete prayout resistance: $V_{Rd,cp} = k \cdot \text{lower value of } N_{Rd,p} \text{ and } N_{Rd,c}$
- Concrete edge resistance: $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_B \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Basic design shear resistance

Design steel resistance $V_{Rd,s}$

Anchor size	M8	M10	M12	M16	M20	M24	M27	M30
$V_{Rd,s}$	HAS 5.8 [kN]	6,8	10,4	15,2	28,8	44,8	64,0	-
	HIT-V 5.8 [kN]	7,2	12,0	16,8	31,2	48,8	70,4	92,0
	HAS 8.8 [kN]	-	-	-	-	-	139,2	168,8
	HIT-V 8.8 [kN]	12,0	18,4	27,2	50,4	78,4	112,8	147,2
	HAS (-E)-R [kN]	7,7	12,2	17,3	32,7	50,6	71,8	45,8
	HIT-V-R [kN]	8,3	12,8	19,2	35,3	55,1	79,5	48,3
	HAS (-E)-HCR [kN]	10,4	16,8	24,8	46,4	72,0	64,0	86,9
	HIT-V-HCR [kN]	12,0	18,4	27,2	50,4	78,4	70,9	92,0

Design concrete prayout resistance $V_{Rd,cp} = \text{lower value}^a) \text{ of } k \cdot N_{Rd,p} \text{ and } k \cdot N_{Rd,c}$

$$k = 2 \text{ for } h_{ef} \geq 60 \text{ mm}$$

- a) $N_{Rd,p}$: Design combined pull-out and concrete cone resistance
 $N_{Rd,c}$: Design concrete cone resistance

Design concrete edge resistance $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_B \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Anchor size	M8	M10	M12	M16	M20	M24	M27	M30
Non-cracked concrete								
$V_{Rd,c}^0$ [kN]	5,9	8,6	11,6	18,7	27,0	36,6	44,5	53,0

Influencing factors

Influence of concrete strength

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25N/mm^2)^{1/2}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of angle between load applied and the direction perpendicular to the free edge

Angle β	0°	10°	20°	30°	40°	50°	60°	70°	80°	≥ 90°
$f_\beta = \sqrt{\frac{1}{(\cos \alpha_v)^2 + \left(\frac{\sin \alpha_v}{2,5}\right)^2}}$	1	1,01	1,05	1,13	1,24	1,40	1,64	1,97	2,32	2,50

Influence of base material thickness

h/c	0,15	0,3	0,45	0,6	0,75	0,9	1,05	1,2	1,35	≥ 1,5
$f_h = \{h/(1,5 \cdot c)\}^{1/2} \leq 1$	0,32	0,45	0,55	0,63	0,71	0,77	0,84	0,89	0,95	1,00

Influence of anchor spacing and edge distance a) for concrete edge resistance: f_4 $f_4 = (c/h_{ef})^{1,5} \cdot (1 + s / [3 \cdot c]) \cdot 0,5$

c/h _{ef}	Single anchor	Group of two anchors s/h _{ef}														
		0,75	1,50	2,25	3,00	3,75	4,50	5,25	6,00	6,75	7,50	8,25	9,00	9,75	10,50	11,25

a) The anchor spacing and the edge distance shall not be smaller than the minimum anchor spacing s_{min} and the minimum edge distance c_{min} .

Influence of embedment depth

h_{ef}/d	4	4,5	5	6	7	8	9	10	11
$f_{hef} = 0,05 \cdot (h_{ef} / d)^{1,68}$	0,51	0,63	0,75	1,01	1,31	1,64	2,00	2,39	2,81
h_{ef}/d	12	13	14	15	16	17	18	19	20
$f_{hef} = 0,05 \cdot (h_{ef} / d)^{1,68}$	3,25	3,72	4,21	4,73	5,27	5,84	6,42	7,04	7,67

Influence of edge distance ^{a)}

c/d	4	6	8	10	15	20	30	40
$f_c = (d / c)^{0,19}$	0,77	0,71	0,67	0,65	0,60	0,57	0,52	0,50

a) The edge distance shall not be smaller than the minimum edge distance c_{min} .

Combined tension and shear loading

For combined tension and shear loading see section “Anchor Design”.

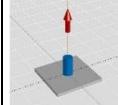

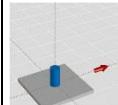

Precalculated values – design resistance values

All data applies to:

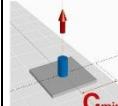

- non-cracked concrete C 20/25 – $f_{ck,cube} = 25 \text{ N/mm}^2$
- temperature range I (see Service temperature range)
- minimum thickness of base material
- no effects of dense reinforcement

Recommended loads can be calculated by dividing the design resistance by an overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

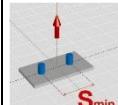

Design resistance: concrete C 20/25 – $f_{ck,cube} = 25 \text{ N/mm}^2$ - minimum embedment depth

Description	Authority / Laboratory	No. / date of issue
European Technical Approval ^{a)}	DIBt, Berlin	ETA-08/0341 / 2013-03-18

a) All data given in this section according ETA-08/0341 issue 2013-03-18.

Basic loading data (for a single anchor)

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Steel failure
- Base material thickness, as specified in the table
- One anchor material, as specified in the tables
- Concrete C 20/25, $f_{ck,cube} = 25$ N/mm²
- Temperate range I
(min. base material temperature -40°C, max. long term/short term base material temperature: +24°C/40°C)
- Installation temperature range -5°C to +40°C

For details see Simplified design method

**Embedment depth and base material thickness for the basic loading data.

a) With overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Service temperature range

Hilti HIT-HY 110 injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

Temperature range	Base material temperature	Maximum long term base material temperature	Maximum short term base material temperature
Temperature range I	-40 °C to +40 °C	+24 °C	+40 °C
Temperature range II	-40 °C to +80 °C	+50 °C	+80 °C
Temperature range III	-40 °C to +120 °C	+72 °C	+120 °C

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

- b) related fastening screw: strength class 70, A5 > 8% Ductile stainless steel 1.4401; 1.4404; 1.4578; 1.4571; 1.4439; 1.4362

Anchor dimensions

Anchor size	M8x90	M10x110	M12x125	M16x170	M20x205
Internal threaded sleeve HIS-N / HIS-RN					
Embedment depth h_{ef} [mm]	80	90	110	125	170

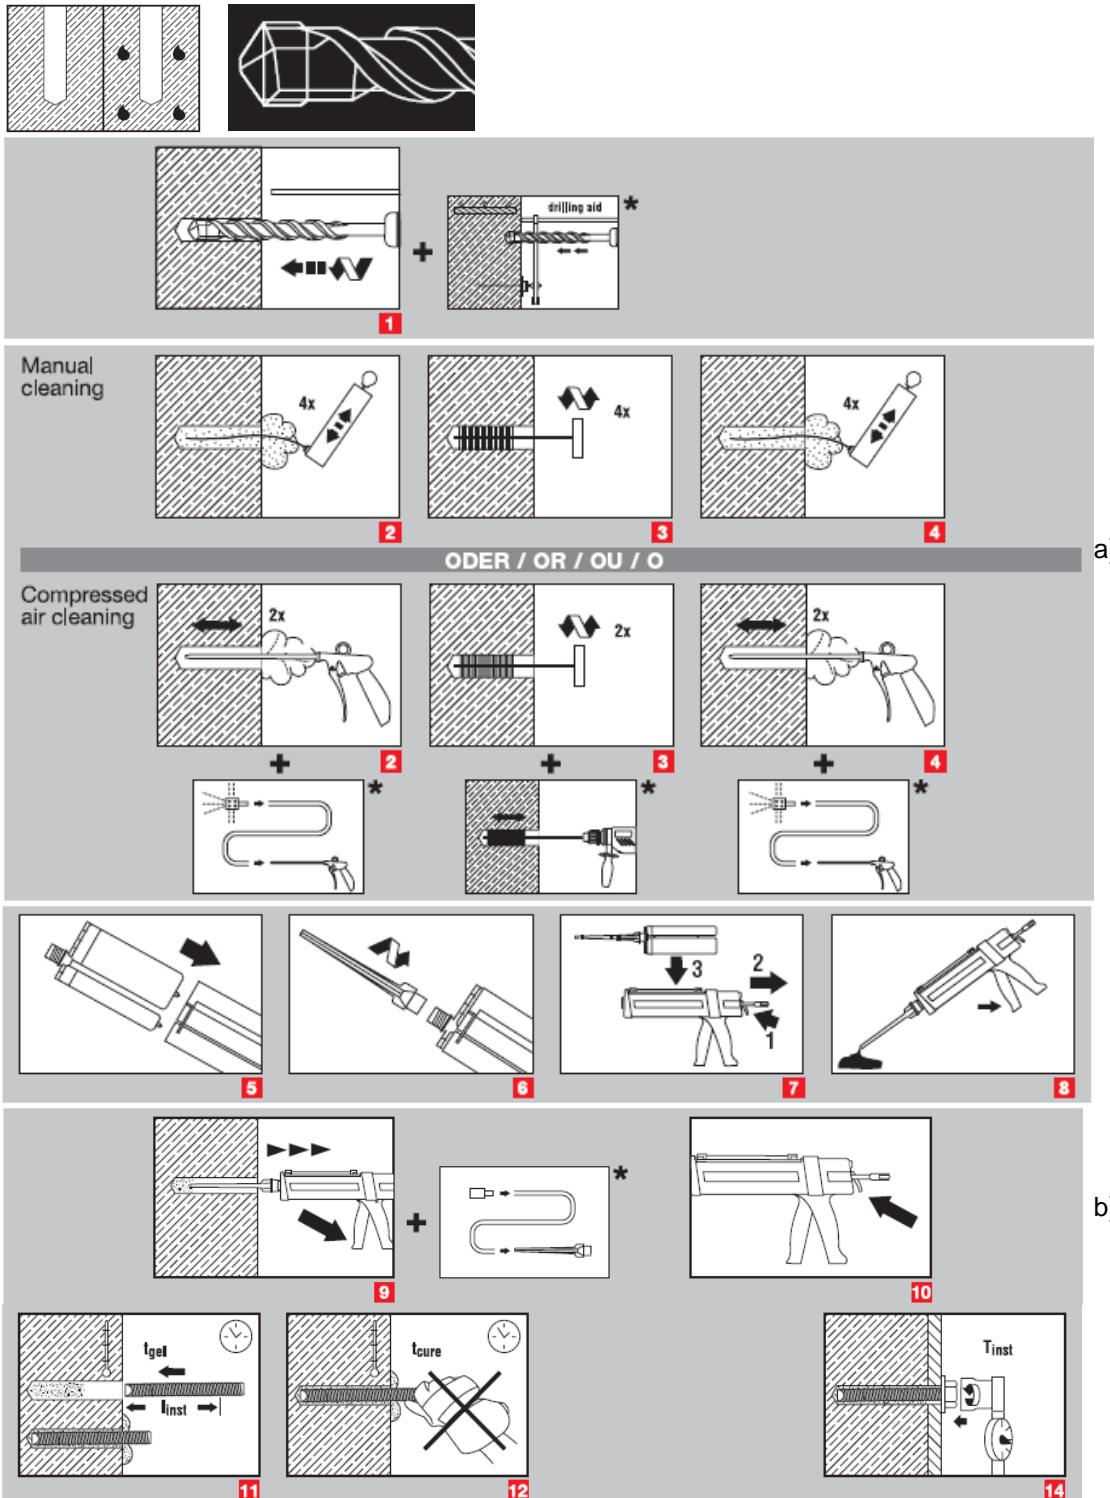

Setting

Installation equipment

Anchor size	M8x90	M10x110	M12x125	M16x170	M20x205
Rotary hammer	TE 2 – TE 30			TE 40 – TE 70	
Other tools					compressed air gun or blow out pump, set of cleaning brushes, dispenser

Setting instruction

Dry and water-saturated concrete, hammer drilling

a) Note: Manual cleaning for drill hole sizes $d_0 \leq 18\text{mm}$ only!

Compressed air cleaning for all bore hole diameters and all bore hole depth

b) Note: Extension and piston plug needed for overhead installation!

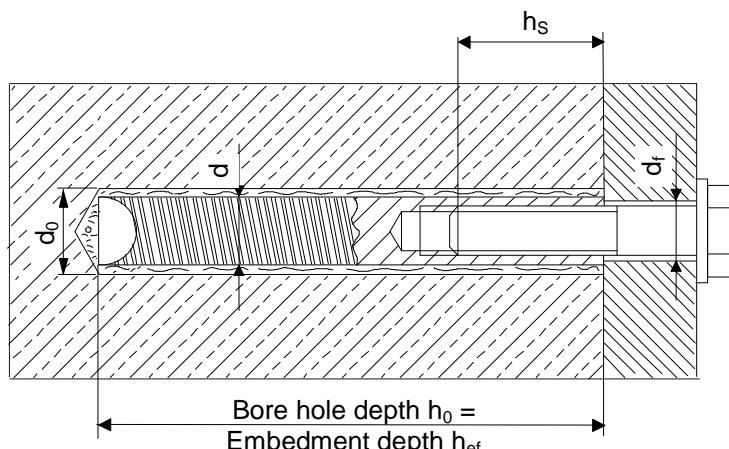

For detailed information on installation see instruction for use given with the package of the product.

Working time, Curing time

Temperature of the base material T_{BM}	Working time t_{gel}	Curing time $t_{cure}^a)$
-5 °C to -1 °C	90 min	9 h
0 °C to 4 °C	45 min	4,5 h
5 °C to 9 °C	20 min	2 h
10 °C to 19 °C	6 min	90 min
20 °C to 29 °C	4 min	50 min
30 °C to 40 °C	2 min	40 min

a) The curing time data are valid for dry anchorage base only. For water saturated anchorage bases the curing times must be doubled.

Setting details

Anchor size	M8x90	M10x110	M12x125	M16x170	M20x205
Nominal diameter of drill bit d_0 [mm]	14	18	22	28	32
Diameter of element d [mm]	12,5	16,5	20,5	25,4	27,6
Effective anchorage and drill hole depth h_{ef} [mm]	90	110	125	170	205
Minimum base material thickness h_{min} [mm]	120	150	170	230	270
Diameter of clearance hole in the fixture d_f [mm]	9	12	14	18	22
Thread engagement length; min - max h_s [mm]	8-20	10-25	12-30	16-40	20-50
Torque moment ^{a)} T_{max} [Nm]	10	20	40	80	150
Minimum spacing s_{min} [mm]	40	45	55	65	90
Minimum edge distance c_{min} [mm]	40	45	55	65	90
Critical spacing for splitting failure $s_{\text{cr,sp}}$ [mm]	2 $c_{\text{cr,sp}}$				
Critical edge distance for splitting failure ^{b)} $c_{\text{cr,sp}}$ [mm]	$1,0 \cdot h_{\text{ef}}$ for $h / h_{\text{ef}} \geq 2,0$				
	$4,6 h_{\text{ef}} - 1,8 h$ for $2,0 > h / h_{\text{ef}} > 1,3$				
	$2,26 h_{\text{ef}}$ for $h / h_{\text{ef}} \leq 1,3$				
Critical spacing for concrete cone failure $s_{\text{cr,N}}$ [mm]	2 $c_{\text{cr,N}}$				
Critical edge distance for concrete cone failure ^{c)} $c_{\text{cr,N}}$ [mm]	1,5 h_{ef}				

For spacing (or edge distance) smaller than critical spacing (or critical edge distance) the design loads have to be reduced.

- a) Maximum recommended torque moment to avoid splitting failure during installation with minimum spacing and/or edge distance.
- b) h : base material thickness ($h \geq h_{\text{min}}$), h_{ef} : embedment depth
- c) The critical edge distance for concrete cone failure depends on the embedment depth h_{ef} and the design bond resistance. The simplified formula given in this table is on the save side.

Simplified design method

Simplified version of the design method according ETAG 001, TR 029.

- Influence of concrete strength
- Influence of edge distance
- Influence of spacing
- Valid for a group of two anchors. (The method may also be applied for anchor groups with more than two anchors or more than one edge distance. The influencing factors must then be considered for each edge distance and spacing. The calculated design loads are then on the save side: They will be lower than the exact values according ETAG 001, TR 029. To avoid this, it is recommended to use the anchor design software PROFIS anchor)

The design method is based on the following simplification:

- No different loads are acting on individual anchors (no eccentricity)

The values are valid for one anchor.

For more complex fastening applications please use the anchor design software PROFIS Anchor.

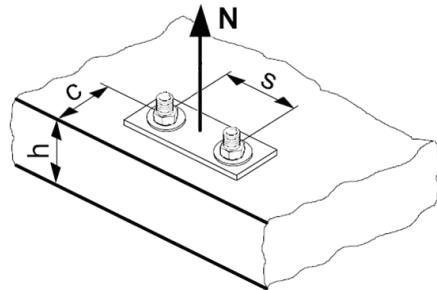

Tension loading

The design tensile resistance is the lower value of

- Steel resistance: $N_{Rd,s}$
- Combined pull-out and concrete cone resistance:

$$N_{Rd,p} = N_{Rd,p}^0 \cdot f_{B,p} \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,p} \cdot f_{re,N}$$
- Concrete cone resistance: $N_{Rd,c} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,N} \cdot f_{re,N}$
- Concrete splitting resistance (only non-cracked concrete):

$$N_{Rd,sp} = N_{Rd,sp}^0 \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,N} \cdot f_{re,N}$$

Basic design tensile resistance

Design steel resistance $N_{Rd,s}$

Anchor size	M8x90	M10x110	M12x125	M16x170	M20x205
$N_{Rd,s}$ HIS-N [kN]	17,5	30,7	44,7	80,3	74,1
$N_{Rd,s}$ HIS-RN [kN]	13,9	21,9	31,6	58,8	69,2

Design combined pull-out and concrete cone resistance

$$N_{Rd,p} = N_{Rd,p}^0 \cdot f_{B,p} \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,p} \cdot f_{re,N}$$

Anchor size	M8x90	M10x110	M12x125	M16x170	M20x205
Embedment depth h_{ef} [mm]	90	110	125	170	205
$N_{Rd,p}^0$ Temperature range I [kN]	23,3	26,7	40,0	63,9	77,8
$N_{Rd,p}^0$ Temperature range II [kN]	13,3	20,0	26,7	41,7	52,8
$N_{Rd,p}^0$ Temperature range III [kN]	10,7	13,3	20,0	27,8	33,3

Design concrete cone resistance $N_{Rd,c} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,N} \cdot f_{re,N}$

Design splitting resistance $N_{Rd,sp} = N_{Rd,sp}^0 \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,N} \cdot f_{re,N}$

Anchor size	M8	M10	M12	M16	M20
$N_{Rd,c}^0$ [kN]	28,7	38,8	47,1	62,2	82,3

Influencing factors

Influence of concrete strength on combined pull-out and concrete cone resistance

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_{B,p} = (f_{ck,cube}/25N/mm^2)^{0,15}$ a)	1,00	1,03	1,06	1,09	1,11	1,13	1,14

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of embedment depth on combined pull-out and concrete cone resistance

$$f_{h,p} = 1$$

Influence of concrete strength on concrete cone resistance

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25N/mm^2)^{0,5}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of edge distance a)

c/c _{cr,N}	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
c/c _{cr,sp}										
$f_{1,N} = 0,7 + 0,3 \cdot c/c_{cr,N} \leq 1$	0,73	0,76	0,79	0,82	0,85	0,88	0,91	0,94	0,97	1
$f_{1,sp} = 0,7 + 0,3 \cdot c/c_{cr,sp} \leq 1$										
$f_{2,N} = 0,5 \cdot (1 + c/c_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{2,sp} = 0,5 \cdot (1 + c/c_{cr,sp}) \leq 1$										

a) The edge distance shall not be smaller than the minimum edge distance c_{min} . These influencing factors must be considered for every edge distance smaller than the critical edge distance.

Influence of anchor spacing a)

s/s _{cr,N}	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
s/s _{cr,sp}										
$f_{3,N} = 0,5 \cdot (1 + s/s_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{3,sp} = 0,5 \cdot (1 + s/s_{cr,sp}) \leq 1$										

a) The anchor spacing shall not be smaller than the minimum anchor spacing s_{min} . This influencing factor must be considered for every anchor spacing.

Influence of embedment depth on concrete cone resistance

$$f_{h,N} = 1$$

Influence of reinforcement

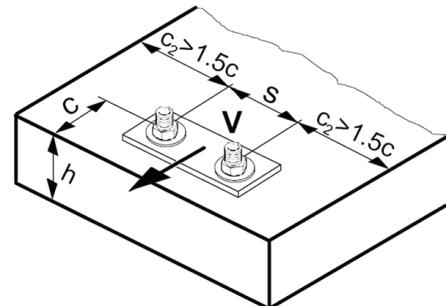

h _{ref} [mm]	40	50	60	70	80	90	≥ 100
$f_{re,N} = 0,5 + h_{ref}/200mm \leq 1$	0,7 a)	0,75 a)	0,8 a)	0,85 a)	0,9 a)	0,95 a)	1

a) This factor applies only for dense reinforcement. If in the area of anchorage there is reinforcement with a spacing ≥ 150 mm (any diameter) or with a diameter ≤ 10 mm and a spacing ≥ 100 mm, then a factor $f_{re,N} = 1$ may be applied.

Shear loading

The design shear resistance is the lower value of

- Steel resistance: $V_{Rd,s}$
- Concrete prout resistance: $V_{Rd,cp} = k \cdot \text{lower value of } N_{Rd,p} \text{ and } N_{Rd,c}$
- Concrete edge resistance: $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_B \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Basic design shear resistance

Design steel resistance $V_{Rd,s}$

Anchor size	M8x90	M10x110	M12x125	M16x170	M20x205
$V_{Rd,s}$ HIS-N [kN]	10,4	18,4	26,0	39,3	36,7
$V_{Rd,s}$ HIS-RN [kN]	8,3	12,8	19,2	35,3	41,5

Design concrete prout resistance $V_{Rd,cp} = \text{lower value}^a) \text{ of } k \cdot N_{Rd,p} \text{ and } k \cdot N_{Rd,c}$

$$k = 2 \text{ for } h_{ef} \geq 60 \text{ mm}$$

a) $N_{Rd,p}$: Design combined pull-out and concrete cone resistance

$N_{Rd,c}$: Design concrete cone resistance

$f_c = (d / c)^{0,19}$	0,77	0,71	0,67	0,65	0,60	0,57	0,52	0,50

a) The edge distance shall not be smaller than the minimum edge distance c_{\min} .

Combined tension and shear loading

For combined tension and shear loading see section "Anchor Design".

Precalculated values – design resistance values

All data applies to:

- non-cracked concrete C 20/25 – $f_{ck,cube} = 25 \text{ N/mm}^2$
- temperature range I (see Service temperature range)
- minimum thickness of base material
- no effects of dense reinforcement

Recommended loads can be calculated by dividing the design resistance by an overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Design resistance: non-cracked- concrete C 20/25

Anchor size	M8x90	M10x110	M12x125	M16x170	M20x205

Approvals / certificates

Description	Authority / Laboratory	No. / date of issue
European Technical Approval ^{a)}	DIBt, Berlin	ETA-08/0341 / 2013-03-18

a) All data given in this section according ETA-08/0341 issue 2013-03-18.

Basic loading data (for a single anchor)

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Steel failure
- Base material thickness, as specified in the table
- One typical embedment depth, as specified in the table
- Anchor material: rebar BSt 500 S
- Concrete C 20/25, $f_{ck,cube} = 25$ N/mm²
- Temperate range I
(min. base material temperature -40°C, max. long term/short term base material temperature: +24°C/40°C)
- Installation temperature range -5°C to +40°C

For details see Simplified design method

Embedment depth^{a)} and base material thickness for the basic loading data. Mean ultimate resistance, characteristic resistance, design resistance, recommended loads.

Anchor size	Ø8	Ø10	Ø12	Ø14	Ø16	Ø20	Ø25
Embedment depth $h_{ef} = h_{ef,typ}$ ^{b)} [mm]	80	90	110	125	170	210	240
Base material thickness h [mm]	110	120	140	165	220	270	300

a) The allowed range of embedment depth is shown in the setting details. The corresponding load values can be calculated according to the simplified design method.

b) $h_{ef,typ}$: Typical embedment depth

Mean ultimate resistance: non-cracked concrete C 20/25 , anchor BSt 500 S

Anchor size	Ø8	Ø10	Ø12	Ø14	Ø16	Ø20	Ø25
Tensile $N_{Ru,m}$ BSt 500 S [kN]	22,8	32,0	47,0	55,0	72,9	106,8	164,9
Shear $V_{Ru,m}$ BSt 500 S [kN]	14,7	23,1	32,6	44,1	57,8	90,3	141,8

Characteristic resistance: non-cracked concrete C 20/25 , anchor BSt 500 S

Anchor size	Ø8	Ø10	Ø12	Ø14	Ø16	Ø20	Ø25
Tensile N_{Rk} BSt 500 S [kN]	17,1	24,0	35,2	41,2	54,7	80,1	123,7
Shear V_{Rk} BSt 500 S [kN]	14,0	22,0	31,0	42,0	55,0	86,0	135,0

Design resistance: non-cracked concrete C 20/25 , anchor BSt 500 S

Anchor size	Ø8	Ø10	Ø12	Ø14	Ø16	Ø20	Ø25
Tensile N_{Rd} BSt 500 S [kN]	11,4	13,4	19,6	19,6	26,0	38,1	58,9
Shear V_{Rd} BSt 500 S [kN]	9,3	14,7	20,7	28,0	36,7	57,3	90,0

Recommended loads^{a)}: non-cracked concrete C 20/25 , anchor BSt 500 S

Anchor size	Ø8	Ø10	Ø12	Ø14	Ø16	Ø20	Ø25
Tensile N_{rec} BSt 500 S [kN]	8,1	9,5	14,0	14,0	18,6	27,2	42,1
Shear V_{rec} BSt 500 S [kN]	6,7	10,5	14,8	20,0	26,2	41,0	64,3

a) With overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Service temperature range

Hilti HIT-HY 110 injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

Temperature range	Base material temperature	Maximum long term base material temperature	Maximum short term base material temperature
Temperature range I	-40 °C to +40 °C	+24 °C	+40 °C
Temperature range II	-40 °C to +80 °C	+50 °C	+80 °C
Temperature range III	-40 °C to +120 °C	+72 °C	+120 °C

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

Materials

Mechanical properties of rebar BSt 500S

Anchor size	Ø8	Ø10	Ø12	Ø14	Ø16	Ø20	Ø25
Nominal tensile strength f_{uk} BSt 500 S [N/mm ²]					550		
Yield strength f_{yk} BSt 500 S [N/mm ²]					500		
Stressed cross-section A_s BSt 500 S [mm ²]	50,3	78,5	113,1	153,9	201,1	314,2	490,9
Moment of resistance W BSt 500 S [mm ³]	50,3	98,2	169,6	269,4	402,1	785,4	1534

Material quality

Part	Material
rebar BSt 500 S	Mechanical properties according to DIN 488-1:1984 Geometry according to DIN 488-21:1986

Anchor dimensions

Anchor size	Ø8	Ø10	Ø12	Ø14	Ø16	Ø20	Ø25
rebar BSt 500 S						rebar are available in variable length	

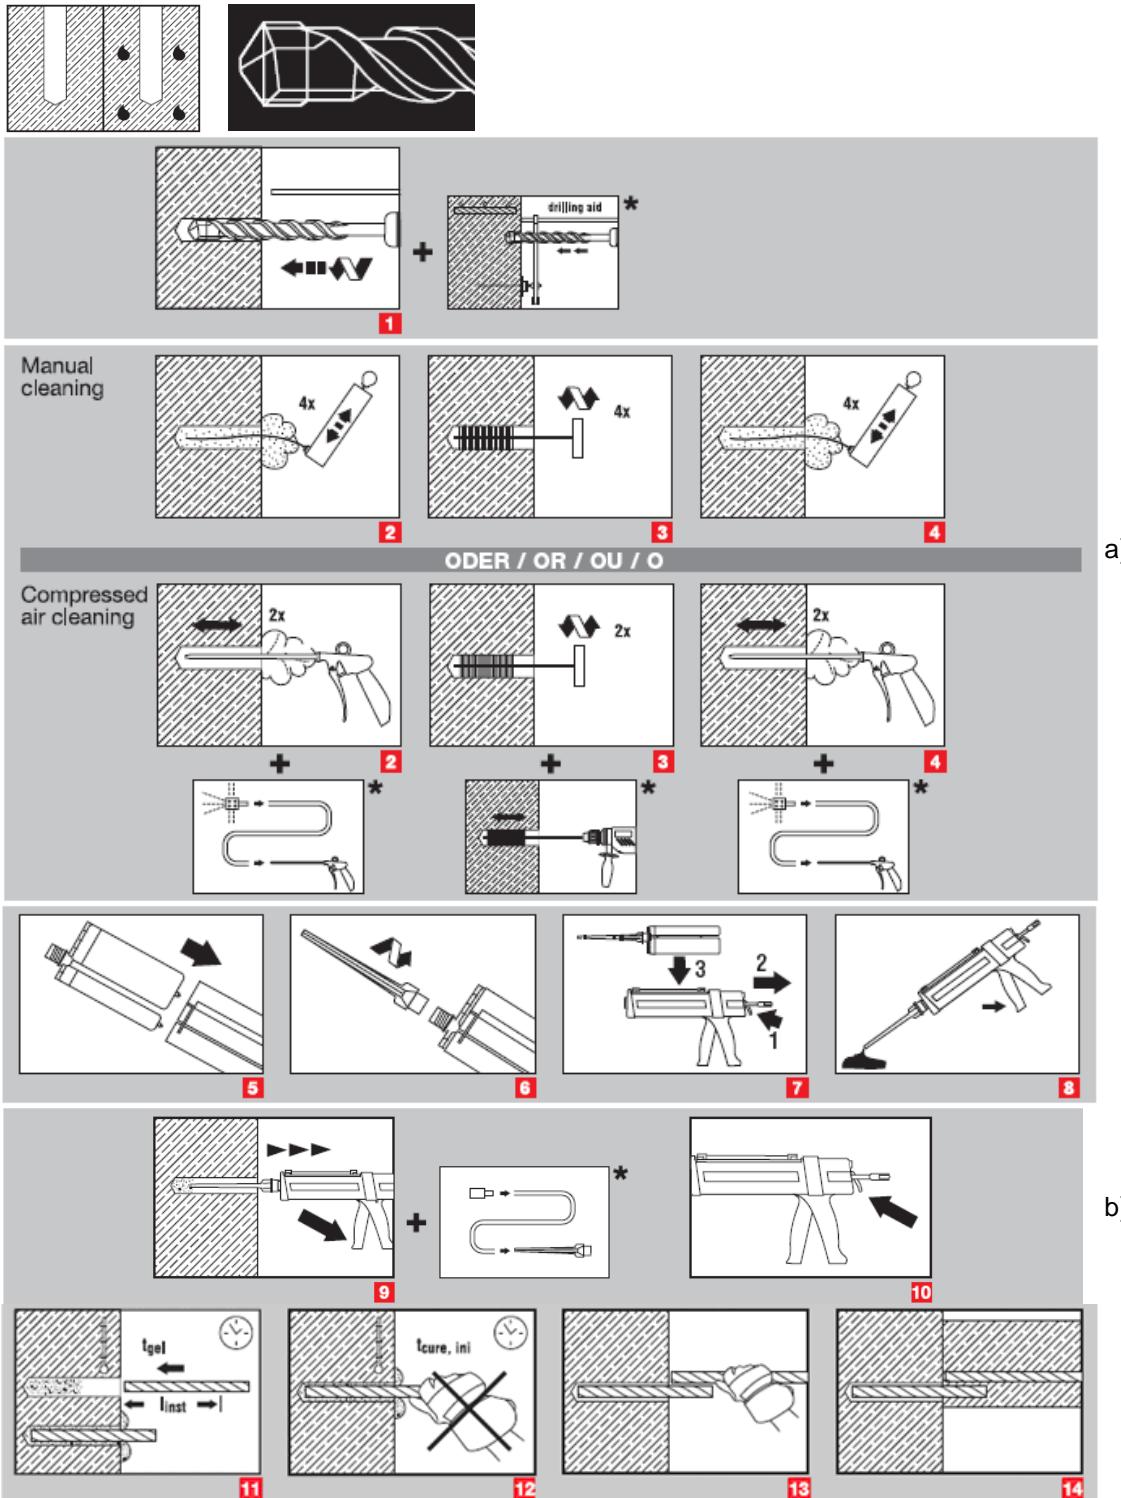

Setting

Installation equipment

Anchor size	Ø8	Ø10	Ø12	Ø14	Ø16	Ø20	Ø25
Rotary hammer				TE 2 – TE 30		TE 40 – TE 70	
Other tools					compressed air gun or blow out pump, set of cleaning brushes, dispenser		

Setting instruction

Dry and water-saturated concrete, hammer drilling

a) Note: Manual cleaning for drill hole sizes $d_0 \leq 18\text{mm}$ and embedment depth $h_{ef} \leq 10\text{ d}$ only!

Compressed air cleaning for all bore hole diameters and all bore hole depth

b) Note: Extension and piston plug needed for overhead installation and/or embedment depth > 250mm!

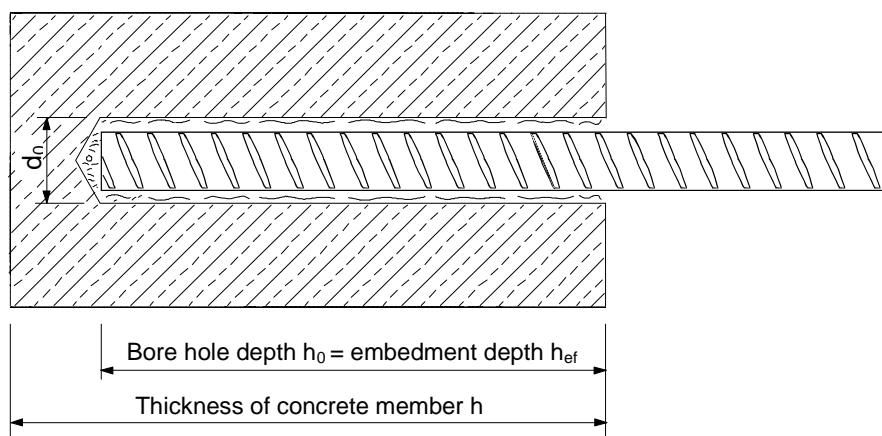

For detailed information on installation see instruction for use given with the package of the product.

Working time, Curing time

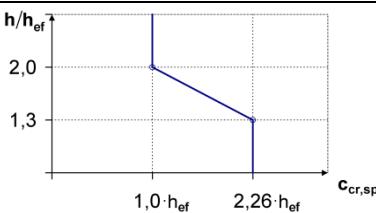

Temperature of the base material T_{BM}	Working time t_{gel}	Curing time $t_{cure}^a)$
-5 °C to -1 °C	90 min	9 h
0 °C to 4 °C	45 min	4,5 h
5 °C to 9 °C	20 min	2 h
10 °C to 19 °C	6 min	90 min
20 °C to 29 °C	4 min	50 min
30 °C to 40 °C	2 min	40 min

a) The curing time data are valid for dry anchorage base only. For water saturated anchorage bases the curing times must be doubled.

Setting details

Anchor size	$\varnothing 8$	$\varnothing 10$	$\varnothing 12$	$\varnothing 14$	$\varnothing 16$	$\varnothing 20$	$\varnothing 25$	
Nominal diameter of drill bit d_0 [mm]	12	14	16	18	20	25	32	
Effective embedment and drill hole depth range ^{a)} for rebar BSt 500 S	$h_{ef,min}$ [mm] $h_{ef,max}$ [mm]	60 160	60 200	70 240	75 280	80 320	90 400	100 500
Minimum base material thickness h_{min} [mm]		$h_{ef} + 30 \text{ mm}$ $\geq 100 \text{ mm}$				$h_{ef} + 2 d_0$		
Minimum spacing s_{min} [mm]		40	50	60	70	80	100	150
Minimum edge distance c_{min} [mm]		40	50	60	80	100	120	150
Critical spacing for splitting failure $s_{cr,sp}$ [mm]						$2 c_{cr,sp}$		
Critical edge distance for splitting failure ^{b)} $c_{cr,sp}$ [mm]			$1,0 \cdot h_{ef}$ for $h / h_{ef} \geq 2,0$					
			$4,6 h_{ef} - 1,8 h$ for $2,0 > h / h_{ef} > 1,3$					
			$2,26 h_{ef}$ for $h / h_{ef} \leq 1,3$					
Critical spacing for concrete cone failure $s_{cr,N}$ [mm]						$2 c_{cr,N}$		
Critical edge distance for concrete cone failure ^{c)} $c_{cr,N}$ [mm]						$1,5 h_{ef}$		

For spacing (or edge distance) smaller than critical spacing (or critical edge distance) the design loads have to be reduced.

- a) Embedment depth range: $h_{ef,min} \leq h_{ef} \leq h_{ef,max}$
- b) h : base material thickness ($h \geq h_{min}$), h_{ef} : embedment depth
- c) The critical edge distance for concrete cone failure depends on the embedment depth h_{ef} and the design bond resistance. The simplified formula given in this table is on the save side.

Simplified design method

Simplified version of the design method according ETAG 001, TR 029.

- Influence of concrete strength
- Influence of edge distance
- Influence of spacing
- Valid for a group of two anchors. (The method may also be applied for anchor groups with more than two anchors or more than one edge distance. The influencing factors must then be considered for each edge distance and spacing. The calculated design loads are then on the same side: They will be lower than the exact values according ETAG 001, TR 029. To avoid this, it is recommended to use the anchor design software PROFIS anchor)

The design method is based on the following simplification:

- No different loads are acting on individual anchors (no eccentricity)

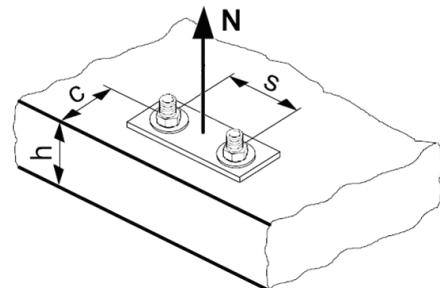

The values are valid for one anchor.

For more complex fastening applications please use the anchor design software PROFIS Anchor.

Tension loading

The design tensile resistance is the lower value of

- Steel resistance: $N_{Rd,s}$
- Combined pull-out and concrete cone resistance: $N_{Rd,p}^0 = N_{Rd,p}^0 \cdot f_{B,p} \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,p} \cdot f_{re,N}$
- Concrete cone resistance: $N_{Rd,c}^0 = N_{Rd,c}^0 \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,N} \cdot f_{re,N}$
- Concrete splitting resistance (only non-cracked concrete): $N_{Rd,sp}^0 = N_{Rd,sp}^0 \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,N} \cdot f_{re,N}$

Basic design tensile resistance

Design steel resistance $N_{Rd,s}$

Anchor size	Ø8	Ø10	Ø12	Ø14	Ø16	Ø20	Ø25
$N_{Rd,s}$ BSt 500 S [kN]	20,0	30,7	44,3	60,7	79,3	123,6	192,9

Design combined pull-out and concrete cone resistance

$$N_{Rd,p} = N_{Rd,p}^0 \cdot f_{B,p} \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,p} \cdot f_{re,N}$$

Anchor size	Ø8	Ø10	Ø12	Ø14	Ø16	Ø20	Ø25
Embedment depth $h_{ef} =$ Typical embedment depth $h_{ef,typ}$ [mm]	80	90	110	125	145	170	210
$N_{Rd,p}^0$ Temperature range I [kN]	11,4	13,4	19,6	19,6	26,0	38,1	58,9
$N_{Rd,p}^0$ Temperature range II [kN]	8,0	9,4	13,8	13,1	17,4	25,4	39,3

$$\text{Design concrete cone resistance } N_{Rd,c} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,N} \cdot f_{re,N}$$

$$\text{Design splitting resistance } N_{Rd,sp} = N_{Rd,sp}^0 \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,N} \cdot f_{re,N}$$

Anchor size	Ø8	Ø10	Ø12	Ø14	Ø16	Ø20	Ø25
$N_{Rd,c}^0$ [kN]	24,1	24,0	32,4	33,6	42,0	53,3	73,2

Influencing factors

Influence of concrete strength on combined pull-out and concrete cone resistance

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_{B,p} = (f_{ck,cube}/25N/mm^2)^{0,15}$ a)	1,00	1,03	1,06	1,09	1,11	1,13	1,14

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of embedment depth on combined pull-out and concrete cone resistance

$$f_{h,p} = h_{ef}/h_{ef,typ}$$

Influence of concrete strength on concrete cone resistance

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25N/mm^2)^{0,5}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of edge distance a)

c/c _{cr,N}	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
c/c _{cr,sp}										
$f_{1,N} = 0,7 + 0,3 \cdot c/c_{cr,N} \leq 1$	0,73	0,76	0,79	0,82	0,85	0,88	0,91	0,94	0,97	1
$f_{1,sp} = 0,7 + 0,3 \cdot c/c_{cr,sp} \leq 1$										
$f_{2,N} = 0,5 \cdot (1 + c/c_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{2,sp} = 0,5 \cdot (1 + c/c_{cr,sp}) \leq 1$										

a) The edge distance shall not be smaller than the minimum edge distance c_{min} . These influencing factors must be considered for every edge distance smaller than the critical edge distance.

Influence of anchor spacing a)

s/s _{cr,N}	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
s/s _{cr,sp}										
$f_{3,N} = 0,5 \cdot (1 + s/s_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{3,sp} = 0,5 \cdot (1 + s/s_{cr,sp}) \leq 1$										

a) The anchor spacing shall not be smaller than the minimum anchor spacing s_{min} . This influencing factor must be considered for every anchor spacing.

Influence of embedment depth on concrete cone resistance

$$f_{h,N} = (h_{ef}/h_{ef,typ})^{1,5}$$

Influence of reinforcement

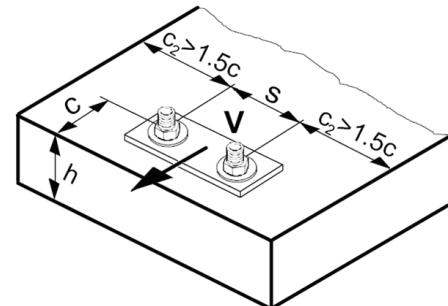

h _{ef} [mm]	40	50	60	70	80	90	≥ 100
$f_{re,N} = 0,5 + h_{ef}/200mm \leq 1$	0,7 a)	0,75 a)	0,8 a)	0,85 a)	0,9 a)	0,95 a)	1

a) This factor applies only for dense reinforcement. If in the area of anchorage there is reinforcement with a spacing ≥ 150 mm (any diameter) or with a diameter ≤ 10 mm and a spacing ≥ 100 mm, then a factor $f_{re,N} = 1$ may be applied.

Shear loading

The design shear resistance is the lower value of

- Steel resistance: $V_{Rd,s}$
- Concrete prout resistance: $V_{Rd,cp} = k \cdot \text{lower value of } N_{Rd,p} \text{ and } N_{Rd,c}$
- Concrete edge resistance: $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_\beta \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Basic design shear resistance

Design steel resistance $V_{Rd,s}$

Anchor size	Ø8	Ø10	Ø12	Ø14	Ø16	Ø20	Ø25
$V_{Rd,s}$ Rebar BSt 500 S [kN]	9,3	14,7	20,7	28,0	36,7	57,3	90,0

Design concrete prout resistance $V_{Rd,cp} = \text{lower value}^a) \text{ of } k \cdot N_{Rd,p} \text{ and } k \cdot N_{Rd,c}$

$$k = 2 \text{ for } h_{ef} \geq 60 \text{ mm}$$

- a) $N_{Rd,p}$: Design combined pull-out and concrete cone resistance
 $N_{Rd,c}$: Design concrete cone resistance

Design concrete edge resistance $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_\beta \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Anchor size	Ø8	Ø10	Ø12	Ø14	Ø16	Ø20	Ø25
Non-cracked concrete							
$V_{Rd,c}^0$ [kN]	5,9	8,6	11,6	15,0	18,7	27,0	39,2

Influencing factors

Influence of concrete strength

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25\text{N/mm}^2)^{1/2} \text{ a)}$	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of angle between load applied and the direction perpendicular to the free edge

Angle β	0°	10°	20°	30°	40°	50°	60°	70°	80°	≥ 90°
$f_\beta = \sqrt{\frac{1}{(\cos \alpha_v)^2 + \left(\frac{\sin \alpha_v}{2,5}\right)^2}}$	1	1,01	1,05	1,13	1,24	1,40	1,64	1,97	2,32	2,50

Influence of base material thickness

h/c	0,15	0,3	0,45	0,6	0,75	0,9	1,05	1,2	1,35	≥ 1,5
$f_h = \{h/(1,5 \cdot c)\}^{1/2} \leq 1$	0,32	0,45	0,55	0,63	0,71	0,77	0,84	0,89	0,95	1,00

Influence of anchor spacing and edge distance ^{a)} for concrete edge resistance: f_4
 $f_4 = (c/h_{ef})^{1,5} \cdot (1 + s / [3 \cdot c]) \cdot 0,5$

c/h _{ef}	Single anchor	Group of two anchors s/h _{ef}														
		0,75	1,50	2,25	3,00	3,75	4,50	5,25	6,00	6,75	7,50	8,25	9,00	9,75	10,50	11,25

a) The anchor spacing and the edge distance shall not be smaller than the minimum anchor spacing s_{min} and the minimum edge distance c_{min} .

Influence of embedment depth

h_{ef}/d	4	4,5	5	6	7	8	9	10	11
$f_{hef} = 0,05 \cdot (h_{ef} / d)^{1,68}$	0,51	0,63	0,75	1,01	1,31	1,64	2,00	2,39	2,81
h_{ef}/d	12	13	14	15	16	17	18	19	20
$f_{hef} = 0,05 \cdot (h_{ef} / d)^{1,68}$	3,25	3,72	4,21	4,73	5,27	5,84	6,42	7,04	7,67

Influence of edge distance ^{a)}

c/d	4	6	8	10	15	20	30	40
$f_c = (d / c)^{0,19}$	0,77	0,71	0,67	0,65	0,60	0,57	0,52	0,50

a) The edge distance shall not be smaller than the minimum edge distance c_{min} .

Combined tension and shear loading

For combined tension and shear loading see section "Anchor Design".

Precalculated values – design resistance values

All data applies to:

- non-cracked concrete C 20/25 – $f_{ck,cube} = 25 \text{ N/mm}^2$
- temperature range I (see Service temperature range)
- minimum thickness of base material
- no effects of dense reinforcement

Recommended loads can be calculated by dividing the design resistance by an overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Description	Authority / Laboratory	No. / date of issue
European Technical Approval ^{a)}	CSTB, Paris France	ETA-14/0009 / 2014-05-24

a) All data given in this section according ETA-14/0009 issue 2014-05-24.

Basic loading data (for a single anchor)

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Steel failure
- Base material thickness, as specified in the table
- One typical embedment depth, as specified in the table
- One anchor material, as specified in the tables
- Concrete C 20/25, $f_{ck,cube} = 25$ N/mm²
- Temperate range I
(min. base material temperature -40°C, max. long term/short term base material temperature: +24°C/40°C)
- Installation temperature range -10°C to +40°C

For details see Simplified design method

**Embedment depth ^{a)} and base material thickness for the basic loading data.
Mean ultimate resistance, characteristic resistance, design resistance, recommended loads.**

Anchor size	M8	M10	M12	M16	M20	M24	M27	M30
Typical embedment depth h_{ef} [mm]	80	90	110	125	170	210	240	270
Base material thickness h [mm]	110	120	140	165	220	270	300	340

a) The allowed range of embedment depth is shown in the setting details. The corresponding load values can be calculated according to the simplified design method.

a) With overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Service temperature range

Hilti HIT-HY 100 injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

Temperature range	Base material temperature	Maximum long term base material temperature	Maximum short term base material temperature
Temperature range I	-40 °C to +40 °C	+24 °C	+40 °C
Temperature range II	-40 °C to +80 °C	+50 °C	+80 °C

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

Materials

Setting

installation equipment

Anchor size	M8	M10	M12	M16	M20	M24	M27	M30
Rotary hammer		TE 2 – TE 30			TE 40 – TE 70			
Other tools		compressed air gun or blow out pump, set of cleaning brushes, dispenser						

Setting instruction

Dry and water-saturated concrete, hammer drilling

a) Note: Manual cleaning for drill hole sizes $d_0 \leq 18\text{mm}$ and embedment depth $h_{ef} \leq 10\text{ d}$ only!

Compressed air cleaning for all bore hole diameters and all bore hole depth

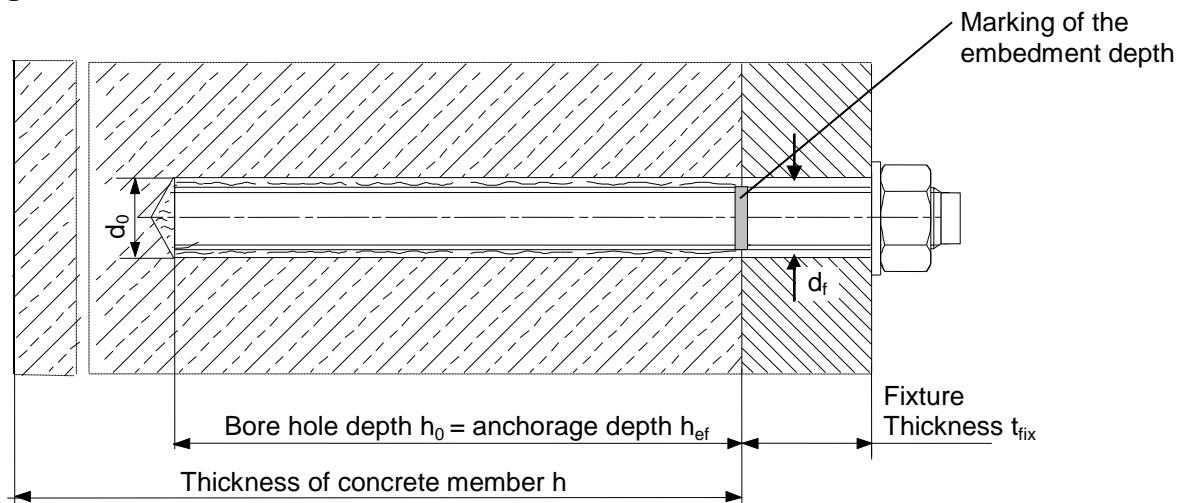

b) Note: Extension and piston plug needed for overhead installation and/or embedment depth $> 250\text{mm}$!

For detailed information on installation see instruction for use given with the package of the product.

Working time, Curing time

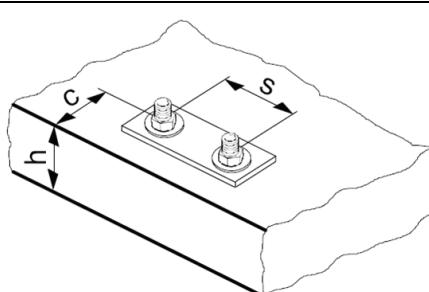

Temperature of the base material T_{BM}	Working time t_{gel}	Curing time $t_{cure}^a)$
-10 °C < TBM < -6 °C	180 min	12 h
-5 °C < TBM < -1 °C	40 min	4 h
0 °C < TBM < +4 °C	20 min	2 h
+5 °C < TBM < +9 °C	8 min	1 h

+15 °C < TBM < +19 °C	6 min	40 min
+20 °C < TBM < +24 °C	5 min	30 min
+25 °C < TBM < +29 °C	3 min	30 min
+30 °C < TBM ≤ +40 °C	2 min	30 min

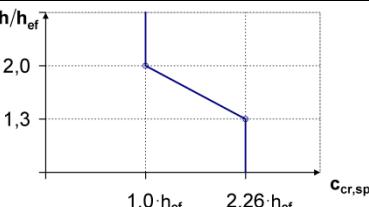

Setting details

Setting details

Anchor size	M8	M10	M12	M16	M20	M24	M27	M30	
Nominal diameter of drill bit d_0 [mm]	10	12	14	18	22	28	30	35	
Effective embedment and drill hole depth range ^{a)} for HIT-V	$h_{ef,min}$ [mm] $h_{ef,max}$ [mm]	60 160	60 200	70 240	80 320	90 400	100 480	110 540	120 600
Minimum base material thickness h_{min} [mm]		$h_{ef} + 30 \text{ mm}$ $\geq 100 \text{ mm}$			$h_{ef} + 2 d_0$				
Diameter of clearance hole in the fixture d_f [mm]	9	12	14	18	22	26	30	33	
Torque moment T_{max} ^{b)} [Nm]	10	20	40	80	150	200	270	300	
Minimum spacing s_{min} [mm]	40	50	60	80	100	120	135	150	
Minimum edge distance c_{min} [mm]	40	50	60	80	100	120	135	150	
Critical spacing for splitting failure $s_{cr,sp}$ [mm]		$2 c_{cr,sp}$							
Critical edge distance for splitting failure ^{c)} $c_{cr,sp}$ [mm]		$1,0 \cdot h_{ef}$ for $h / h_{ef} \geq 2,0$ $4,6 h_{ef} - 1,8 h$ for $2,0 > h / h_{ef} > 1,3$ $2,26 h_{ef}$ for $h / h_{ef} \leq 1,3$							
Critical spacing for concrete cone failure $s_{cr,N}$ [mm]		$2 c_{cr,N}$							
Critical edge distance for concrete cone failure ^{d)} $c_{cr,N}$ [mm]		$1,5 h_{ef}$							

For spacing (or edge distance) smaller than critical spacing (or critical edge distance) the design loads have to be reduced.

- a) Embedment depth range: $h_{ef,min} \leq h_{ef} \leq h_{ef,max}$
- b) Maximum recommended torque moment to avoid splitting failure during installation with minimum spacing and/or edge distance.
- c) h: base material thickness ($h \geq h_{min}$), h_{ef} : embedment depth
- d) The critical edge distance for concrete cone failure depends on the embedment depth h_{ef} and the design bond resistance. The simplified formula given in this table is on the save side.

Simplified design method

Simplified version of the design method according ETAG 001, TR 029.

- Influence of concrete strength
- Influence of edge distance
- Influence of spacing
- Valid for a group of two anchors. (The method may also be applied for anchor groups with more than two anchors or more than one edge distance. The influencing factors must then be considered for each edge distance and spacing. The calculated design loads are then on the same side: They will be lower than the exact values according ETAG 001, TR 029. To avoid this, it is recommended to use the anchor design software PROFIS anchor)

The design method is based on the following simplification:

- No different loads are acting on individual anchors (no eccentricity)

The values are valid for one anchor.

For more complex fastening applications please use the anchor design software PROFIS Anchor.

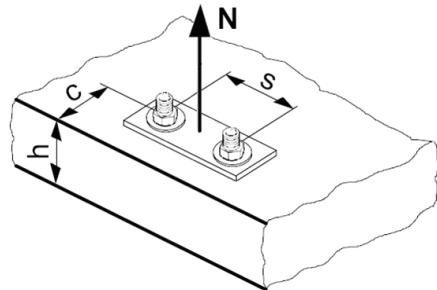

Tension loading

The design tensile resistance is the lower value of

- Steel resistance: $N_{Rd,s}$
- Combined pull-out and concrete cone resistance:

$$N_{Rd,p} = N_{Rd,c}^0 \cdot f_{B,p} \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,p} \cdot f_{re,N}$$
- Concrete cone resistance: $N_{Rd,c} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,N} \cdot f_{re,N}$
- Concrete splitting resistance (only non-cracked concrete):

$$N_{Rd,sp} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,N} \cdot f_{re,N}$$

Basic design tensile resistance

Design steel resistance $N_{Rd,s}$

Influencing factors

Influence of concrete strength on combined pull-out and concrete cone resistance

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_{B,p} = (f_{ck,cube}/25N/mm^2)^{0,15}$ a)	1,00	1,02	1,04	1,06	1,07	1,08	1,09

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of embedment depth on combined pull-out and concrete cone resistance

$$f_{h,p} = h_{ef}/h_{ef,typ}$$

Influence of concrete strength on concrete cone resistance

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25N/mm^2)^{0,5}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of edge distance a)

$c/c_{cr,N}$	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$f_{1,N} = 0,7 + 0,3 \cdot c/c_{cr,N} \leq 1$	0,73	0,76	0,79	0,82	0,85	0,88	0,91	0,94	0,97	1
$f_{1,sp} = 0,7 + 0,3 \cdot c/c_{cr,sp} \leq 1$										
$f_{2,N} = 0,5 \cdot (1 + c/c_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{2,sp} = 0,5 \cdot (1 + c/c_{cr,sp}) \leq 1$										

a) The edge distance shall not be smaller than the minimum edge distance c_{min} . These influencing factors must be considered for every edge distance smaller than the critical edge distance.

Influence of anchor spacing a)

$s/s_{cr,N}$	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$s/s_{cr,sp}$										
$f_{3,N} = 0,5 \cdot (1 + s/s_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{3,sp} = 0,5 \cdot (1 + s/s_{cr,sp}) \leq 1$										

a) The anchor spacing shall not be smaller than the minimum anchor spacing s_{min} . This influencing factor must be considered for every anchor spacing.

Influence of embedment depth on concrete cone resistance

$$f_{h,N} = (h_{ef}/h_{ef,typ})^{1,5}$$

Influence of reinforcement

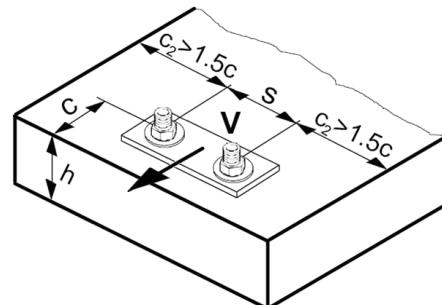

h_{ef} [mm]	40	50	60	70	80	90	≥ 100
$f_{re,N} = 0,5 + h_{ef}/200\text{mm} \leq 1$	0,7 a)	0,75 a)	0,8 a)	0,85 a)	0,9 a)	0,95 a)	1

a) This factor applies only for dense reinforcement. If in the area of anchorage there is reinforcement with a spacing ≥ 150 mm (any diameter) or with a diameter ≤ 10 mm and a spacing ≥ 100 mm, then a factor $f_{re,N} = 1$ may be applied.

Shear loading

The design shear resistance is the lower value of

- Steel resistance: $V_{Rd,s}$
- Concrete prayout resistance: $V_{Rd,cp} = k \cdot \text{lower value of } N_{Rd,p} \text{ and } N_{Rd,c}$
- Concrete edge resistance: $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_B \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Basic design shear resistance

Design steel resistance $V_{Rd,s}$

Anchor size	M8	M10	M12	M16	M20	M24	M27	M30	
$V_{Rd,s}$	HIT-V 5.8 [kN]	7,2	12,0	16,8	31,2	48,8	70,4	92,0	112,0

a) The anchor spacing and the edge distance shall not be smaller than the minimum anchor spacing s_{\min} and the minimum edge distance c_{\min} .

Influence of embedment depth

h _{ef} /d	4	4,5	5	6	7	8	9	10	11
$f_{hef} = 0,05 \cdot (h_{\text{ef}} / d)^{1,68}$	0,51	0,63	0,75	1,01	1,31	1,64	2,00	2,39	2,81
h _{ef} /d	12	13	14	15	16	17	18	19	20
$f_{hef} = 0,05 \cdot (h_{\text{ef}} / d)^{1,68}$	3,25	3,72	4,21	4,73	5,27	5,84	6,42	7,04	7,67

Influence of edge distance ^{a)}

c/d	4	6	8	10	15	20	30	40
$f_c = (d / c)^{0,19}$	0,77	0,71	0,67	0,65	0,60	0,57	0,52	0,50

a) The edge distance shall not be smaller than the minimum edge distance c_{\min} .

Combined tension and shear loading

For combined tension and shear loading see section “Anchor Design”.

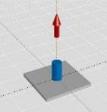

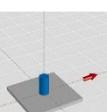

Precalculated values – design resistance values

All data applies to:

- non-cracked concrete C 20/25 – $f_{ck,cube} = 25 \text{ N/mm}^2$
- temperature range I (see Service temperature range)
- minimum thickness of base material
- no effects of dense reinforcement

Recommended loads can be calculated by dividing the design resistance by an overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Design resistance: concrete C 20/25 – $f_{ck,cube} = 25 \text{ N/mm}^2$ - minimum embedment depth

Description	Authority / Laboratory	No. / date of issue
European Technical Approval ^{a)}	CSTB, Paris France	ETA-14/0009 / 2014-05-24

a) All data given in this section according ETA-14/0009 issue 2014-05-24.

Basic loading data (for a single anchor)

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- **Steel failure**
- Base material thickness, as specified in the table
- **One anchor material**, as specified in the tables
- Concrete C 20/25, $f_{ck,cube} = 25$ N/mm²
- Temperate range I
(min. base material temperature -40°C, max. long term/short term base material temperature: +24°C/40°C)
- Installation temperature range -10°C to +40°C

For details see Simplified design method

**Embedment depth and base material thickness for the basic loading data.
 Mean ultimate resistance, characteristic resistance, design resistance, recommended loads.**

Anchor size	M8x90	M10x110	M12x125	M16x170	M20x205

Recommended loads ^{a)}: non-cracked concrete C 20/25 , anchor HIS-N

Anchor size	M8x90	M10x110	M12x125	M16x170	M20x205
Tensile N_{rec} HIS-N [kN]	12,5	19,8	28,0	37,7	45,6
Shear V_{rec} HIS-N [kN]	7,4	13,1	18,6	28,1	26,2

a) With overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Service temperature range

Hilti HIT-HY 100 injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

Temperature range	Base material temperature	Maximum long term base material temperature	Maximum short term base material temperature
Temperature range I	-40 °C to +40 °C	+24 °C	+40 °C
Temperature range II	-40 °C to +80 °C	+50 °C	+80 °C

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

+30 °C < TBM ≤ +40 °C	2 min	30 min

Setting details

Anchor size	M8x90	M10x110	M12x125	M16x170	M20x205
Nominal diameter of drill bit d_0 [mm]	14	18	22	28	32
Diameter of element d [mm]	12,5	16,5	20,5	25,4	27,6
Effective anchorage and drill hole depth h_{ef} [mm]	90	110	125	170	205
Minimum base material thickness h_{min} [mm]	120	150	170	230	270
Diameter of clearance hole in the fixture d_f [mm]	9	12	14	18	22
Thread engagement length; min - max h_s [mm]	8-20	10-25	12-30	16-40	20-50
Torque moment ^{a)} T_{max} [Nm]	10	20	40	80	150
Minimum spacing s_{min} [mm]	40	45	55	65	90
Minimum edge distance c_{min} [mm]	40	45	55	65	90
Critical spacing for splitting failure $s_{\text{cr,sp}}$ [mm]	$2 c_{\text{cr,sp}}$				
Critical edge distance for splitting failure ^{b)} $c_{\text{cr,sp}}$ [mm]	$1,0 \cdot h_{\text{ef}}$ for $h / h_{\text{ef}} \geq 2,0$				
	$4,6 h_{\text{ef}} - 1,8 h$ for $2,0 > h / h_{\text{ef}} > 1,3$				
	$2,26 h_{\text{ef}}$ for $h / h_{\text{ef}} \leq 1,3$				
Critical spacing for concrete cone failure $s_{\text{cr,N}}$ [mm]	$2 c_{\text{cr,N}}$				
Critical edge distance for concrete cone failure ^{c)} $c_{\text{cr,N}}$ [mm]	$1,5 h_{\text{ef}}$				

For spacing (or edge distance) smaller than critical spacing (or critical edge distance) the design loads have to be reduced.

- a) Maximum recommended torque moment to avoid splitting failure during installation with minimum spacing and/or edge distance.
- b) h : base material thickness ($h \geq h_{\text{min}}$), h_{ef} : embedment depth
- c) The critical edge distance for concrete cone failure depends on the embedment depth h_{ef} and the design bond resistance. The simplified formula given in this table is on the save side.

Simplified design method

Simplified version of the design method according ETAG 001, TR 029.

- Influence of concrete strength
- Influence of edge distance
- Influence of spacing
- Valid for a group of two anchors. (The method may also be applied for anchor groups with more than two anchors or more than one edge distance. The influencing factors must then be considered for each edge distance and spacing. The calculated design loads are then on the same side: They will be lower than the exact values according ETAG 001, TR 029. To avoid this, it is recommended to use the anchor design software PROFIS anchor)

The design method is based on the following simplification:

- No different loads are acting on individual anchors (no eccentricity)

The values are valid for one anchor.

For more complex fastening applications please use the anchor design software PROFIS Anchor.

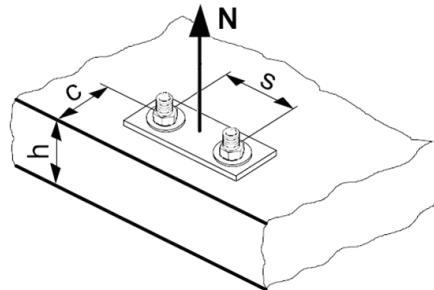

Tension loading

The design tensile resistance is the lower value of

- Steel resistance: $N_{Rd,s}$
- Combined pull-out and concrete cone resistance:

$$N_{Rd,p} = N_{Rd,p}^0 \cdot f_{B,p} \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,p} \cdot f_{re,N}$$
- Concrete cone resistance: $N_{Rd,c} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,N} \cdot f_{re,N}$
- Concrete splitting resistance (only non-cracked concrete):

$$N_{Rd,sp} = N_{Rd,sp}^0 \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,N} \cdot f_{re,N}$$

Basic design tensile resistance

Design steel resistance $N_{Rd,s}$

Anchor size	M8x90	M10x110	M12x125	M16x170	M20x205
$N_{Rd,s}$ HIS-N [kN]	17,5	30,7	44,7	80,3	74,1
$N_{Rd,s}$ HIS-RN [kN]	13,9	21,9	31,6	58,8	69,2

Design combined pull-out and concrete cone resistance

$$N_{Rd,p} = N_{Rd,p}^0 \cdot f_{B,p} \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,p} \cdot f_{re,N}$$

Anchor size	M8x90	M10x110	M12x125	M16x170	M20x205
Embedment depth h_{ef} [mm]	90	110	125	170	205
$N_{Rd,p}^0$ Temperature range I [kN]	19,4	27,8	41,7	52,8	63,9
$N_{Rd,p}^0$ Temperature range II [kN]	16,7	27,8	33,3	52,8	52,8

$$\text{Design concrete cone resistance } N_{Rd,c} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,N} \cdot f_{re,N}$$

$$\text{Design splitting resistance } N_{Rd,sp} = N_{Rd,sp}^0 \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,N} \cdot f_{re,N}$$

Anchor size	M8	M10	M12	M16	M20
$N_{Rd,c}^0$ [kN]	24,0	32,4	39,2	62,2	82,3

Influencing factors

Influence of concrete strength on combined pull-out and concrete cone resistance

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_{B,p} = (f_{ck,cube}/25N/mm^2)^{0,15}$ a)	1,00	1,02	1,04	1,06	1,07	1,08	1,09

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of embedment depth on combined pull-out and concrete cone resistance

$$f_{h,p} = 1$$

Influence of concrete strength on concrete cone resistance

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25N/mm^2)^{0,5}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of edge distance a)

c/c _{cr,N}	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
c/c _{cr,sp}										
$f_{1,N} = 0,7 + 0,3 \cdot c/c_{cr,N} \leq 1$	0,73	0,76	0,79	0,82	0,85	0,88	0,91	0,94	0,97	1
$f_{1,sp} = 0,7 + 0,3 \cdot c/c_{cr,sp} \leq 1$										
$f_{2,N} = 0,5 \cdot (1 + c/c_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{2,sp} = 0,5 \cdot (1 + c/c_{cr,sp}) \leq 1$										

a) The edge distance shall not be smaller than the minimum edge distance c_{min} . These influencing factors must be considered for every edge distance smaller than the critical edge distance.

Influence of anchor spacing a)

s/s _{cr,N}	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
s/s _{cr,sp}										
$f_{3,N} = 0,5 \cdot (1 + s/s_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{3,sp} = 0,5 \cdot (1 + s/s_{cr,sp}) \leq 1$										

a) The anchor spacing shall not be smaller than the minimum anchor spacing s_{min} . This influencing factor must be considered for every anchor spacing.

Influence of embedment depth on concrete cone resistance

$$f_{h,N} = 1$$

Influence of reinforcement

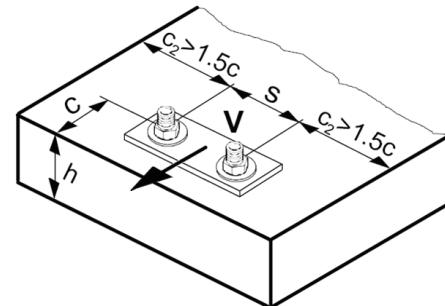

h _{ref} [mm]	40	50	60	70	80	90	≥ 100
$f_{re,N} = 0,5 + h_{ref}/200mm \leq 1$	0,7 a)	0,75 a)	0,8 a)	0,85 a)	0,9 a)	0,95 a)	1

a) This factor applies only for dense reinforcement. If in the area of anchorage there is reinforcement with a spacing ≥ 150 mm (any diameter) or with a diameter ≤ 10 mm and a spacing ≥ 100 mm, then a factor $f_{re,N} = 1$ may be applied.

Shear loading

The design shear resistance is the lower value of

- Steel resistance: $V_{Rd,s}$
- Concrete prout resistance: $V_{Rd,cp} = k \cdot \text{lower value of } N_{Rd,p} \text{ and } N_{Rd,c}$
- Concrete edge resistance: $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_B \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Basic design shear resistance

Design steel resistance $V_{Rd,s}$

Anchor size	M8x90	M10x110	M12x125	M16x170	M20x205
$V_{Rd,s}$ HIS-N [kN]	10,4	18,4	26,0	39,3	36,7
HIS-RN [kN]	8,3	12,8	19,2	35,3	41,5

Design concrete prout resistance $V_{Rd,cp} = \text{lower value}^a) \text{ of } k \cdot N_{Rd,p} \text{ and } k \cdot N_{Rd,c}$

$$k = 2 \text{ for } h_{ef} \geq 60 \text{ mm}$$

a) $N_{Rd,p}$: Design combined pull-out and concrete cone resistance

$N_{Rd,c}$: Design concrete cone resistance

Design concrete edge resistance $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_B \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Anchor size	M8	M10	M12	M16	M20
Non-cracked concrete					
$V_{Rd,c}^0$ [kN]	12,4	19,6	28,2	40,2	46,2

Influencing factors

Influence of concrete strength

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25\text{N/mm}^2)^{1/2} \text{ a)}$	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of angle between load applied and the direction perpendicular to the free edge

Angle β	0°	10°	20°	30°	40°	50°	60°	70°	80°	≥ 90°

a) The anchor spacing and the edge distance shall not be smaller than the minimum anchor spacing s_{min} and the minimum edge distance c_{min} .

Influence of embedment depth

Anchor size	M8	M10	M12	M16	M20
$f_{hef} =$	1,38	1,21	1,04	1,22	1,45

Influence of edge distance ^{a)}

c/d	4	6	8	10	15	20	30	40
$f_c = (d / c)^{0,19}$	0,77	0,71	0,67	0,65	0,60	0,57	0,52	0,50

a) The edge distance shall not be smaller than the minimum edge distance c_{min} .

Combined tension and shear loading

For combined tension and shear loading see section "Anchor Design".

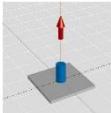

Precalculated values – design resistance values

All data applies to:

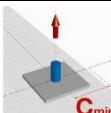

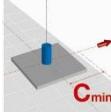

- non-cracked concrete C 20/25 – $f_{ck,cube} = 25 \text{ N/mm}^2$
- temperature range I (see Service temperature range)
- minimum thickness of base material
- no effects of dense reinforcement

Recommended loads can be calculated by dividing the design resistance by an overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Description	Authority / Laboratory	No. / date of issue
European Technical Approval ^{a)}	CSTB, Paris	ETA-14/0009 / 2014-05-24

a) All data given in this section according ETA-14/0009 issue 2014-05-24.

Basic loading data (for a single anchor)

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Steel failure
- Base material thickness, as specified in the table
- One typical embedment depth, as specified in the table
- Anchor material: rebar B500 B
- Concrete C 20/25, $f_{ck,cube} = 25$ N/mm²
- Temperate range I
(min. base material temperature -40°C, max. long term/short term base material temperature: +24°C/40°C)
- Installation temperature range -5°C to +40°C

For details see Simplified design method

Embedment depth ^{a)} and base material thickness for the basic loading data. Mean ultimate resistance, characteristic resistance, design resistance, recommended loads.

Anchor size	Ø8	Ø10	Ø12	Ø14	Ø16	Ø20	Ø25
Embedment depth $h_{ef} = h_{ef,typ}$ ^{b)} [mm]	80	90	110	125	145	170	210
Base material thickness h [mm]	110	120	140	165	185	220	274

a) The allowed range of embedment depth is shown in the setting details. The corresponding load values can be calculated according to the simplified design method.

b) $h_{ef,typ}$: Typical embedment depth

Mean ultimate resistance: concrete C 20/25 , anchor B500 B

a) With overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Service temperature range

Hilti HIT-HY 100 injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

Temperature range	Base material temperature	Maximum long term base material temperature	Maximum short term base material temperature
Temperature range I	-40 °C to +40 °C	+24 °C	+40 °C
Temperature range II	-40 °C to +80 °C	+50 °C	+80 °C

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

Materials

Mechanical properties of rebar B500 B

Anchor size	Ø8	Ø10	Ø12	Ø14	Ø16	Ø20	Ø25
Nominal tensile strength f_{uk} B500 B [N/mm ²]					550		
Yield strength f_{yk} B500 B [N/mm ²]					500		
Stressed cross-section A_s B500 B [mm ²]	50,3	78,5	113,1	153,9	201,1	314,2	490,9
Moment of resistance W B500 B [mm ³]	50,3	98,2	169,6	269,4	402,1	785,4	1534

Material quality

Part	Material
rebar B500 B	EN 1992-1-1:2004 and AC:2010, Annex C Bars and de-coiled rods Class B or C with fyk and k according to NDP or NCL of EN 1992-1-1/NA:2013

Anchor dimensions

Anchor size	Ø8	Ø10	Ø12	Ø14	Ø16	Ø20	Ø25
rebar B500 B					rebar are available in variable length		

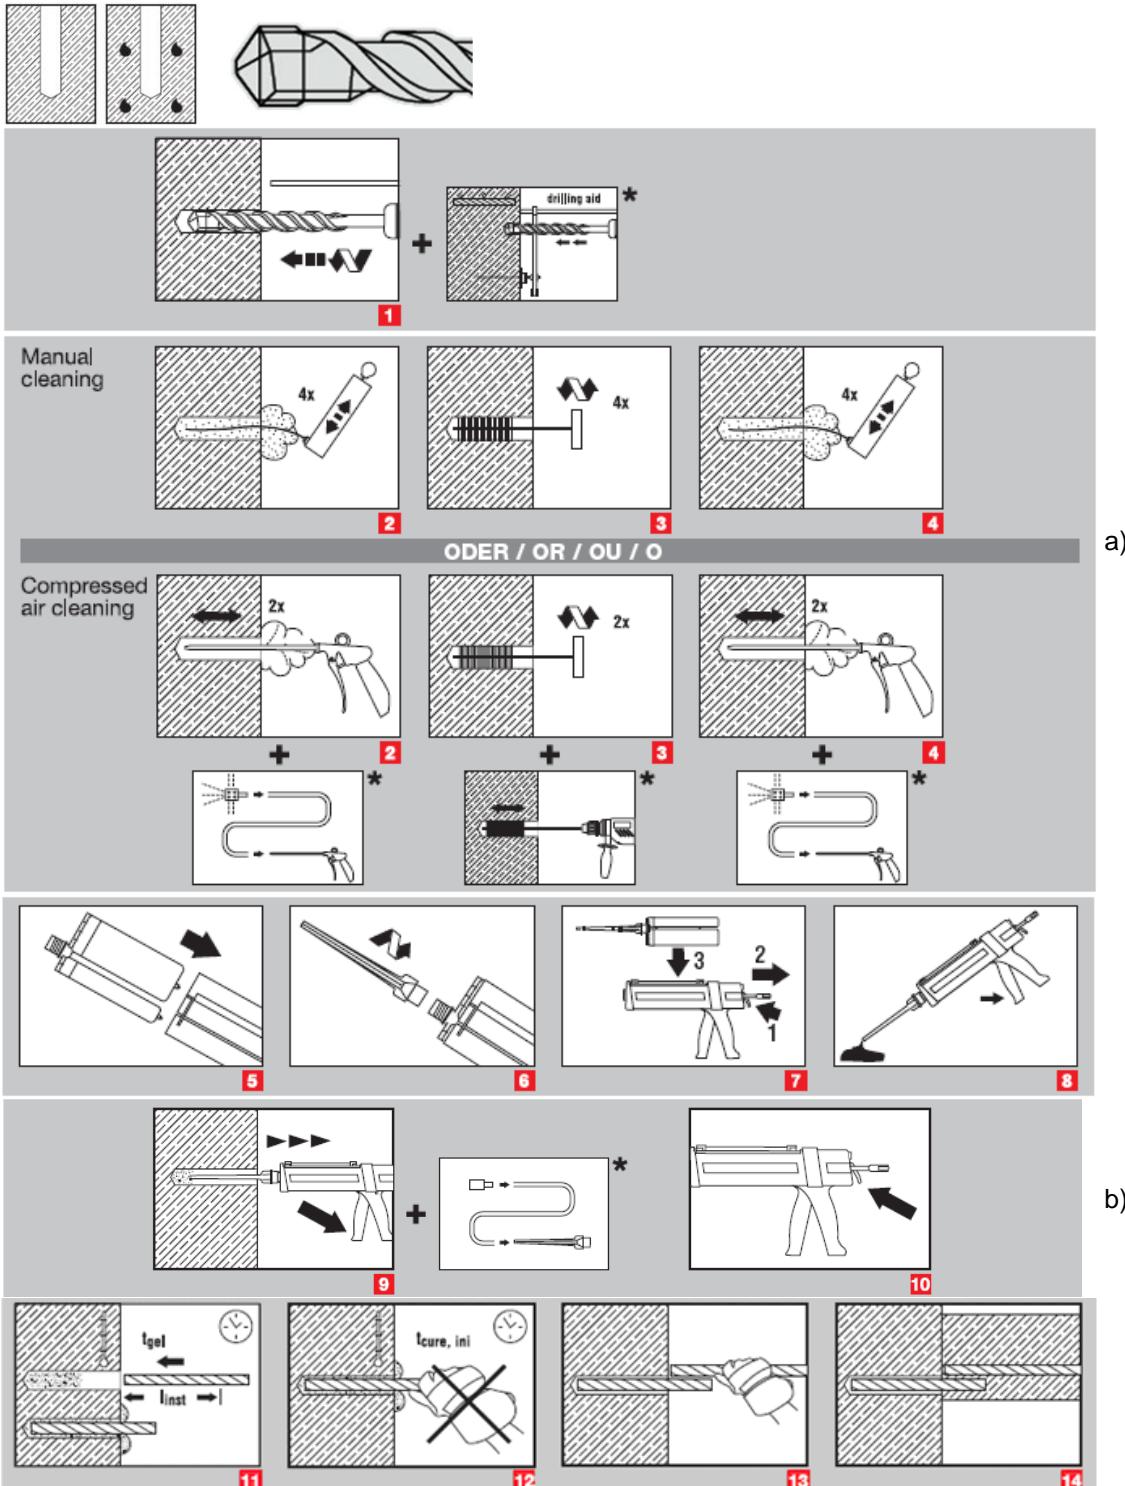

Setting

Installation equipment

Anchor size	Ø8	Ø10	Ø12	Ø14	Ø16	Ø20	Ø25
Rotary hammer				TE 2 – TE 30		TE 40 – TE 70	
Other tools					compressed air gun or blow out pump, set of cleaning brushes, dispenser		

Setting instruction

Dry and water-saturated concrete, hammer drilling

a) Note: Manual cleaning for drill hole sizes $d_0 \leq 18\text{mm}$ and embedment depth $h_{ef} \leq 10\text{ d}$ only!

Manual cleaning for uncracked concrete only!

Compressed air cleaning for all bore hole diameters and all bore hole depth

b) Note: Extension and piston plug needed for overhead installation and/or embedment depth $> 250\text{mm}$!

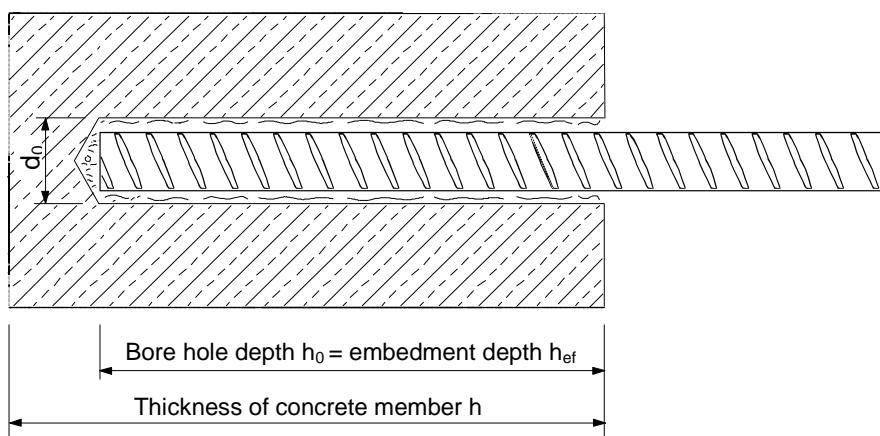

For detailed information on installation see instruction for use given with the package of the product.

Working time, Curing time

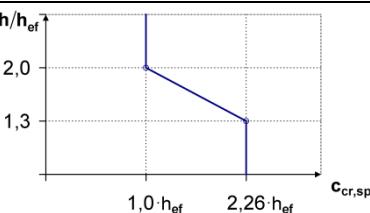

Temperature of the base material T_{BM}	Working time t_{gel}	Curing time $t_{cure}^a)$
-5 °C to -1 °C	90 min	9 h
0 °C to 4 °C	45 min	4,5 h
5 °C to 9 °C	20 min	2 h
10 °C to 19 °C	6 min	90 min
20 °C to 29 °C	4 min	50 min
30 °C to 40 °C	2 min	41 min

a) The curing time data are valid for dry anchorage base only. For water saturated anchorage bases the curing times must be doubled.

Setting details

Anchor size		$\varnothing 8$	$\varnothing 10$	$\varnothing 12$	$\varnothing 14$	$\varnothing 16$	$\varnothing 20$	$\varnothing 25$
Nominal diameter of drill bit	d_0 [mm]	12	14	16	18	20	25	32
Effective embedment and drill hole depth range ^{a)} for rebar B500 B	$h_{\text{ef,min}}$ [mm] $h_{\text{ef,max}}$ [mm]	60 160	60 200	70 240	80 280	80 320	90 400	100 500
Minimum base material thickness	h_{\min} [mm]	$h_{\text{ef}} + 30 \text{ mm}$		$h_{\text{ef}} + 2 d_0$				
Minimum spacing	s_{\min} [mm]	40	50	60	70	80	100	125
Minimum edge distance	c_{\min} [mm]	40	50	60	70	80	100	125
Critical spacing for splitting failure	$s_{\text{cr,sp}}$ [mm]	$2 c_{\text{cr,sp}}$						
Critical edge distance for splitting failure ^{b)}	$c_{\text{cr,sp}}$ [mm]	$1,0 \cdot h_{\text{ef}}$ for $h / h_{\text{ef}} \geq 2,0$ $4,6 h_{\text{ef}} - 1,8 h$ for $2,0 > h / h_{\text{ef}} > 1,3$ $2,26 h_{\text{ef}}$ for $h / h_{\text{ef}} \leq 1,3$						
Critical spacing for concrete cone failure	$s_{\text{cr,N}}$ [mm]	$2 c_{\text{cr,N}}$						
Critical edge distance for concrete cone failure ^{c)}	$c_{\text{cr,N}}$ [mm]	$1,5 h_{\text{ef}}$						

For spacing (or edge distance) smaller than critical spacing (or critical edge distance) the design loads have to be reduced.

- a) Embedment depth range: $h_{\text{ef,min}} \leq h_{\text{ef}} \leq h_{\text{ef,max}}$
- b) h : base material thickness ($h \geq h_{\min}$), h_{ef} : embedment depth
- c) The critical edge distance for concrete cone failure depends on the embedment depth h_{ef} and the design bond resistance. The simplified formula given in this table is on the save side.

Simplified design method

Simplified version of the design method according ETAG 001, TR 029.

- Influence of concrete strength
- Influence of edge distance
- Influence of spacing
- Valid for a group of two anchors. (The method may also be applied for anchor groups with more than two anchors or more than one edge distance. The influencing factors must then be considered for each edge distance and spacing. The calculated design loads are then on the same side: They will be lower than the exact values according ETAG 001, TR 029. To avoid this, it is recommended to use the anchor design software PROFIS anchor)

The design method is based on the following simplification:

- No different loads are acting on individual anchors (no eccentricity)

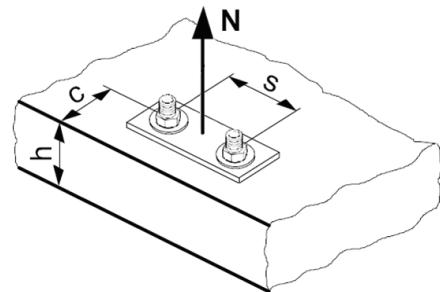

The values are valid for one anchor.

For more complex fastening applications please use the anchor design software PROFIS Anchor.

Tension loading

The design tensile resistance is the lower value of

- Steel resistance: $N_{Rd,s}$
- Combined pull-out and concrete cone resistance: $N_{Rd,p}^0 = N_{Rd,p}^0 \cdot f_{B,p} \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,p} \cdot f_{re,N}$
- Concrete cone resistance: $N_{Rd,c}^0 = N_{Rd,c}^0 \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,N} \cdot f_{re,N}$
- Concrete splitting resistance (only non-cracked concrete): $N_{Rd,sp}^0 = N_{Rd,sp}^0 \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,N} \cdot f_{re,N}$

Basic design tensile resistance

Design steel resistance $N_{Rd,s}$

Anchor size	Ø8	Ø10	Ø12	Ø14	Ø16	Ø20	Ø25
$N_{Rd,s}$ B500 B [kN]	20,0	30,7	44,3	60,7	79,3	123,6	192,9

Design combined pull-out and concrete cone resistance

$$N_{Rd,p}^0 = N_{Rd,p}^0 \cdot f_{B,p} \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,p} \cdot f_{re,N}$$

$N_{Rd,c}^0$ Cracked concrete [kN]	-	17,1	23,1	28,0	34,9	-	-

Influencing factors

Influence of concrete strength on combined pull-out and concrete cone resistance

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_{B,p} = (f_{ck,cube}/25\text{N/mm}^2)^{0,15}$ a)	1,00	1,02	1,04	1,06	1,07	1,08	1,09

 a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of embedment depth on combined pull-out and concrete cone resistance

$$f_{h,p} = h_{ef}/h_{ef,typ}$$

Influence of concrete strength on concrete cone resistance

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25\text{N/mm}^2)^{0,5}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

 a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of edge distance a)

$c/c_{cr,N}$	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$f_{1,N} = 0,7 + 0,3 \cdot c/c_{cr,N} \leq 1$	0,73	0,76	0,79	0,82	0,85	0,88	0,91	0,94	0,97	1
$f_{1,sp} = 0,7 + 0,3 \cdot c/c_{cr,sp} \leq 1$										
$f_{2,N} = 0,5 \cdot (1 + c/c_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{2,sp} = 0,5 \cdot (1 + c/c_{cr,sp}) \leq 1$										

 a) The edge distance shall not be smaller than the minimum edge distance c_{min} . These influencing factors must be considered for every edge distance smaller than the critical edge distance.

Influence of anchor spacing a)

$s/s_{cr,N}$	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$s/s_{cr,sp}$										
$f_{3,N} = 0,5 \cdot (1 + s/s_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{3,sp} = 0,5 \cdot (1 + s/s_{cr,sp}) \leq 1$										

 a) The anchor spacing shall not be smaller than the minimum anchor spacing s_{min} . This influencing factor must be considered for every anchor spacing.

Influence of embedment depth on concrete cone resistance

$$f_{h,N} = (h_{ef}/h_{ef,typ})^{1,5}$$

Influence of reinforcement

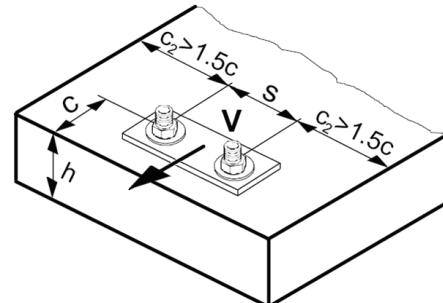

h_{ef} [mm]	40	50	60	70	80	90	≥ 100
$f_{re,N} = 0,5 + h_{ef}/200\text{mm} \leq 1$	0,7 a)	0,75 a)	0,8 a)	0,85 a)	0,9 a)	0,95 a)	1

a) This factor applies only for dense reinforcement. If in the area of anchorage there is reinforcement with a spacing ≥ 150 mm (any diameter) or with a diameter ≤ 10 mm and a spacing ≥ 100 mm, then a factor $f_{re,N} = 1$ may be applied.

Shear loading

The design shear resistance is the lower value of

- Steel resistance: $V_{Rd,s}$
- Concrete prout resistance: $V_{Rd,cp} = k \cdot \text{lower value of } N_{Rd,p} \text{ and } N_{Rd,c}$
- Concrete edge resistance: $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_B \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Basic design shear resistance

Design steel resistance $V_{Rd,s}$

Anchor size	$\varnothing 8$	$\varnothing 10$	$\varnothing 12$	$\varnothing 14$	$\varnothing 16$	$\varnothing 20$	$\varnothing 25$
$V_{Rd,s}$ Rebar B500 B [kN]	9,3	14,7	20,7	28,0	36,7	57,3	90,0

Design concrete prout resistance $V_{Rd,cp} = \text{lower value}^a) \text{ of } k \cdot N_{Rd,p} \text{ and } k \cdot N_{Rd,c}$

$$k = 2 \text{ for } h_{ef} \geq 60 \text{ mm}$$

- a) $N_{Rd,p}$: Design combined pull-out and concrete cone resistance
 $N_{Rd,c}$: Design concrete cone resistance

Design concrete edge resistance $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_B \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

a) The anchor spacing and the edge distance shall not be smaller than the minimum anchor spacing s_{min} and the minimum edge distance c_{min} .

Influence of embedment depth

h_{ef}/d	4	4,5	5	6	7	8	9	10	11
$f_{hef} = 0,05 \cdot (h_{ef} / d)^{1,68}$	0,51	0,63	0,75	1,01	1,31	1,64	2,00	2,39	2,81
h_{ef}/d	12	13	14	15	16	17	18	19	20
$f_{hef} = 0,05 \cdot (h_{ef} / d)^{1,68}$	3,25	3,72	4,21	4,73	5,27	5,84	6,42	7,04	7,67

Influence of edge distance ^{a)}

c/d	4	6	8	10	15	20	30	40
$f_c = (d / c)^{0,19}$	0,77	0,71	0,67	0,65	0,60	0,57	0,52	0,50

a) The edge distance shall not be smaller than the minimum edge distance c_{min} .

Combined tension and shear loading

For combined tension and shear loading see section “Anchor Design”.

Precalculated values – design resistance values

All data applies to:

- non-cracked concrete C 20/25 – $f_{ck,cube} = 25 \text{ N/mm}^2$
- temperature range I (see Service temperature range)
- minimum thickness of base material
- no effects of dense reinforcement

Recommended loads can be calculated by dividing the design resistance by an overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Approvals / certificates

Description	Authority / Laboratory	No. / date of issue
European Technical Approval	DIBt, Berlin	ETA-09/0265 / 2009-09-28
Allgemeine bauaufsichtliche Zulassung (national German approval)	DIBt, Berlin	Z-21.3-1830 / 2011-12-01
Fiche technique SOCOTEC ^{a)}	SOCOTEC, Paris	YX 0047 06.2012
Fire test report	MFPA, Leipzig	PB III/B-07-157 / 2012-03-03
Assessment report (fire)	warringtonfire	WF 327804/B / 2013-07-10

Basic loading data (for a single anchor)

All data in the table below applies to

- Load values valid for holes drilled with TE rotary hammers in hammering mode
- Correct anchor setting (see instruction for use, setting details)
- Steel quality of fastening elements: see data below
- Steel quality for screws for HIT-IG, HIT-IC and HIS-N: min. strength 5.8 / HIS-RN: A4-70
- Threaded rods of appropriate size (diameter and length) and a minimum steel quality of 5.6 can be used
- Base material temperature during installation and curing must be between -5°C through +40°C

(Exception: solid clay bricks (e.g. Mz12): +5°C till 40°C)

Recommended loads^{a)} F_{rec} for brick breakout and pull out in [kN]

Solid masonry: HIT-HY 70 with HIT-V, HAS, HAS-E and HIT-IC

Anchor size			HIT-V, HAS, HAS-E				HIT-IC		
Base material	Setting depth [mm]		M6	M8	M10	M12	M8	M10	M12

 b) f_b brick strength

Design

Influence of joints:

If the joints of the masonry are not visible the recommended load N_{rec} has to be reduced with the factor $\alpha_j = 0,75$.

If the joints of the masonry are visible (e.g. unplastered wall) following has to be taken into account:

- The recommended load N_{rec} may be used only, if the wall is designed such that the joints are to be filled with mortar.
- If the wall is designed such that the joints are not to be filled with mortar then the recommended load N_{rec} may be used only, if the minimum edge distance c_{min} to the vertical joints is observed. If this minimum edge distance c_{min} can not be observed then the recommended load N_{rec} has to be reduced with the factor $\alpha_j = 0,75$.

The decisive resistance to tension loads is the lower value of N_{rec} (brick breakout, pull out) and $N_{max,pb}$ (pull out of one brick).

Pull out of one brick:

The allowable load of an anchor or a group of anchors in case of pull out of one brick, $N_{max,pb}$ [kN], is given in the following tables:

Clay bricks:

N _{max,pb} [kN]		brick breadth b _{brick} [mm]					
		80	120	200	240	300	360
brick length l _{brick} [mm]	240	1,1	1,6	2,7	3,3	4,1	4,9
	300	1,4	2,1	3,4	4,1	5,1	6,2
	500	2,3	3,4	5,7	6,9	8,6	10,3

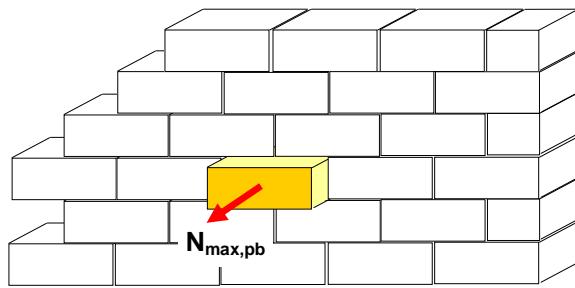

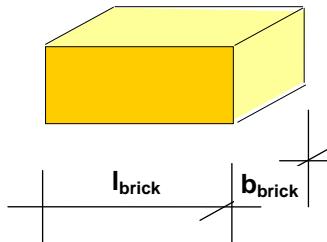

All other brick types:

N _{max,pb} [kN]		brick breadth b _{brick} [mm]					
		80	120	200	240	300	360
brick length l _{brick} [mm]	240	0,8	1,2	2,1	2,5	3,1	3,7
	300	1,0	1,5	2,6	3,1	3,9	4,6
	500	1,7	2,6	4,3	5,1	6,4	7,7

$N_{max,pb}$ = resistance for pull out of one brick

l_{brick} = length of the brick

b_{brick} = breadth of the brick

For all applications outside of the above mentioned base materials and / or setting conditions site tests have to be made for the determination of load values.

Due to the wide variety of natural stones site tests have to be made for determine of load values.

Materials

Material quality HAS / HIT-V

Part	Material
Threaded rod HAS-(E) / HIT-V	Strength class 5.8, A ₅ > 8% ductile steel galvanized ≥ 5 µm
Threaded rod HAS-(E)R / HIT-V	Stainless steel grade A4, A ₅ > 8% ductile strength class 70, 1.4401; 1.4404; 1.4578; 1.4571; 1.4439; 1.4362
Washer ISO 7089	Steel galvanized, Stainless steel, 1.4401; 1.4404; 1.4578; 1.4571; 1.4439; 1.4362
Nut EN ISO 4032	Strength class 8, steel galvanized ≥ 5 µm Strength class 70, stainless steel grade A4, 1.4401; 1.4404; 1.4578; 1.4571; 1.4439; 1.4362 Strength class 70, high corrosion resistant steel, 1.4529; 1.4565

Description	Authority / Laboratory	No. / date of issue
European technical approval ^{a)}	CSTB, Paris	ETA-11/0354 / 2012-08-27

a) All data given in this section according ETA-11/0354 issue 2012-08-27.

Basic loading data (for a single anchor)

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Steel failure
- Base material thickness, as specified in the table
- One typical embedment depth, as specified in the table
- One anchor material, as specified in the tables
- Concrete C 20/25, $f_{ck,cube} = 25 \text{ N/mm}^2$
- Temperate range I
(min. base material temperature -40°C, max. long term/short term base material temperature: +24°C/40°C)
- Installation temperature range -5°C to +40°C

For details see Simplified design method

Embedment depth ^{a)} and base material thickness for the basic loading data.

Mean ultimate resistance, characteristic resistance, design resistance, recommended loads.

Anchor size	M8	M10	M12	M16	M20	M24
Typical embedment depth h_{ef} [mm]	80	90	110	130	170	210
Base material thickness h [mm]	110	120	140	170	220	270

a) The allowed range of embedment depth is shown in the setting details. The corresponding load values can be calculated according to the simplified design method.

Mean ultimate resistance: non-cracked concrete C 20/25 , anchor HIT-V 5.8

Anchor size	M8	M10	M12	M16	M20	M24
Tensile $N_{Ru,m}$ HIT-V 5.8 [kN]	18,9	30,5	44,1	87,1	135,3	190,0
Shear $V_{Ru,m}$ HIT-V 5.8 [kN]	9,5	15,8	22,1	41,0	64,1	92,4

Characteristic resistance: non-cracked concrete C 20/25 , anchor HIT-V 5.8

Anchor size	M8	M10	M12	M16	M20	M24
Tensile N_{Rk} HIT-V 5.8 [kN]	18,0	29,0	42,0	65,3	101,5	142,5
Shear V_{Rk} HIT-V 5.8 [kN]	9,0	15,0	21,0	39,0	61,0	88,0

Design resistance: non-cracked concrete C 20/25 , anchor HIT-V 5.8

Anchor size	M8	M10	M12	M16	M20	M24
Tensile N_{Rd} HIT-V 5.8 [kN]	12,0	17,3	25,3	36,3	56,4	79,2
Shear V_{Rd} HIT-V 5.8 [kN]	7,2	12,0	16,8	31,2	48,8	70,4

Recommended loads ^{a)}: non-cracked concrete C 20/25 , anchor HIT-V 5.8

Anchor size	M8	M10	M12	M16	M20	M24
Tensile N_{rec} HIT-V 5.8 [kN]	8,6	12,3	18,1	25,9	40,3	56,5
Shear V_{rec} HIT-V 5.8 [kN]	5,1	8,6	12,0	22,3	34,9	50,3

a) With overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations. According ETAG 001, annex C, the partial safety factor is $\gamma_G = 1,35$ for permanent actions and $\gamma_Q = 1,5$ for variable actions.

Service temperature range

Hilti HIT-CT 1 injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

Temperature range	Base material temperature	Maximum long term base material temperature	Maximum short term base material temperature
Temperature range I	-40 °C to +40 °C	+24 °C	+40 °C
Temperature range II	-40 °C to +80 °C	+50 °C	+80 °C

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

Materials

Mechanical properties of HIT-V

Anchor size	M8	M10	M12	M16	M20	M24

Anchor dimensions

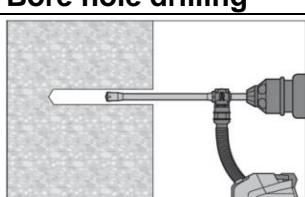

Anchor size	M8	M10	M12	M16	M20	M24
Anchor rod HIT-V, HIT-V-F HIT-V-R, HIT-V-HCR						

Anchor rods HIT-V (-F/ -R / -HCR) are available in variable length

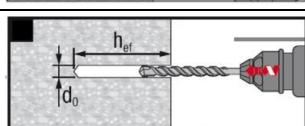

Setting instruction

Dry and water-saturated concrete, hammer drilling

Bore hole drilling

Drill hole to the required embedment depth with an appropriately sized Hilti TE-CD or TE-YD hollow drill bit with Hilti vacuum attachment. This drilling method properly cleans the borehole and removes dust while drilling. After drilling is complete, proceed to the "injection preparation" step in the instructions for use.

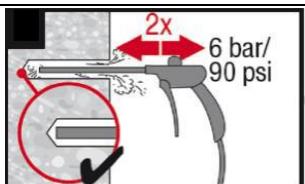

Drill hole to the required embedment depth with a hammer drill set in rotation-hammer mode using an appropriately sized carbide drill bit.

Bore hole cleaning

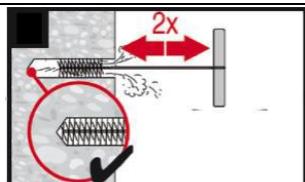

Just before setting an anchor, the bore hole must be free of dust and debris by one of two cleaning methods described below:

a) Compressed air cleaning (CAC)

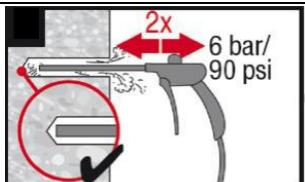

For all bore hole diameters d_0 and all bore hole depth h_0

Blow 2 times from the back of the hole (if needed with nozzle extension) over the hole length with oil-free compressed air (min. 6 bar at 6 m³/h) until return air stream is free of noticeable dust.

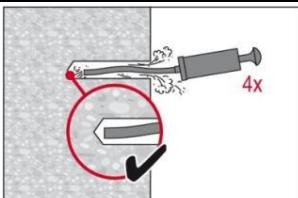

Brush 2 times with the specified brush size (brush $\varnothing \geq$ bore hole \varnothing , see Table 5) by inserting the steel brush Hilti HIT-RB to the back of the hole (if needed with extension) in a twisting motion and removing it. The brush must produce natural resistance as it enters the bore hole -- if not, the brush is too small and must be replaced with the proper brush diameter.

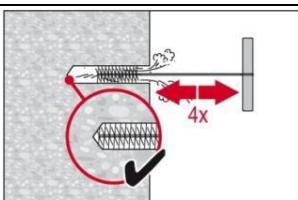

Blow again with compressed air 2 times until return air stream is free of noticeable dust.

b) Manual Cleaning (MC)

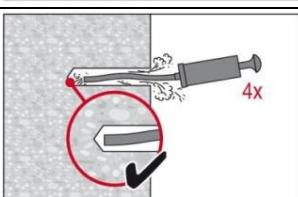

As an alternative to compressed air cleaning, a manual cleaning is permitted for hammer drilled boreholes for bore hole diameters $d_0 \leq 20\text{mm}$ and bore hole depth $h_0 \leq 10d_s$. The borehole must be free of dust, debris, water, ice, oil, grease and other contaminants prior to mortar injection.

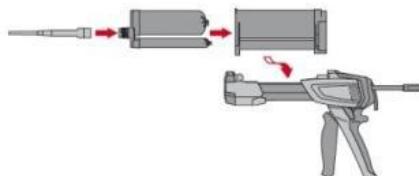

The Hilti manual pump may be used for blowing out bore holes up to diameters $d_0 \leq 20\text{ mm}$ and embedment depths up to $h_{ef} \leq 10d_s$. Blow out at least 4 times from the back of the bore hole until return air stream is free of noticeable dust.

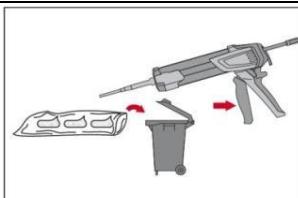

Brush 4 times with the specified brush size (brush $\varnothing \geq$ bore hole \varnothing , see Table 5) by inserting the steel brush Hilti HIT-RB to the back of the hole (if needed with extension) in a twisting motion and removing it. The brush must produce natural resistance as it enters the bore hole -- if not, the brush is too small and must be replaced with the proper brush diameter.

Blow out again with manual pump at least 4 times until return air stream is free of noticeable dust.

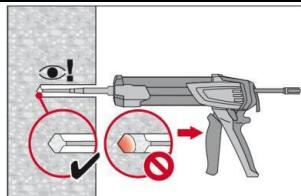

Injection preparation

Observe the Instruction for Use of the dispenser.
Observe the Instruction for Use of the mortar.
Tightly attach Hilti HIT-RE-M mixing nozzle to foil pack manifold.
Insert foil pack into foil pack holder and swing holder into the dispenser.

Discard initial adhesive. The foil pack opens automatically as dispensing is initiated. Depending on the size of the foil pack an initial amount of adhesive has to be discarded.
Discard quantities are
2 strokes for 330 ml foil pack
3 strokes for 500 ml foil pack

Inject adhesive from the back of the borehole without forming air voids

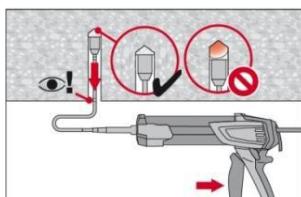

Injection method for borehole depth ≤ 250 mm:

Inject the mortar from the back of the hole towards the front and slowly withdraw the mixing nozzle step by step after each trigger pull. **Important!** **Use extensions for deep holes > 250 mm.** Fill holes approximately 2/3 full, or as required to ensure that the annular gap between the rebar and the concrete is completely filled with adhesive over the embedment length.

After injecting, depressurize the dispenser by pressing the release trigger (only for manual dispenser). This will prevent further mortar discharge from the mixing nozzle.

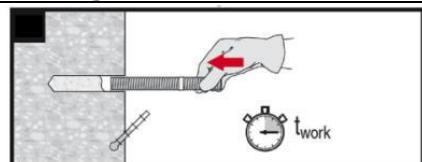

Piston plug injection for borehole depth > 250 mm or overhead applications: Assemble mixing nozzle, extension(s) and appropriately sized piston plug. Insert piston plug to back of the hole. Begin injection allowing the pressure of the injected adhesive mortar to push the piston plug towards the front of the hole. After injecting, depressurize the dispenser by pressing the release trigger. This will prevent further mortar discharge from the mixing nozzle. The proper injection of mortar using a piston plug HIT-SZ prevents the creation of air voids. The piston plug must be insertable to the back of the borehole without resistance. During injection the piston plug will be pressed towards the front of the borehole slowly by mortar pressure. Attention! Pulling the injection or when changing the foil pack, the piston plug is rendered inactive and air voids may occur.

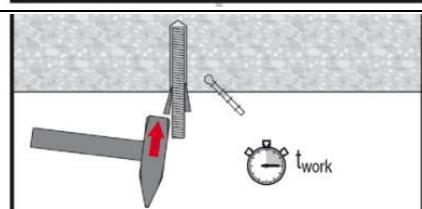

Dispenser types with related foil pack sizes:

HDM 330	Manual dispenser (330 ml)
HDM 500	Manual dispenser (330 / 500 ml)
HDE 500-A22	Electric dispenser (330 / 500 ml)

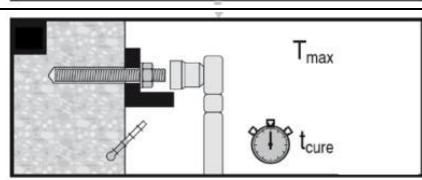

Setting the element

Before use, verify that the element is dry and free of oil and other contaminants. Mark and set element to the required embedment depth till working time t_{work} has elapsed. The working time t_{work} is given in the table below.

For overhead installation use piston plugs and fix embedded parts with e.g. wedges.

Loading the anchor: After required curing time t_{cure} (see Table below) the anchor can be loaded.

For detailed information on installation see instruction for use given with the package of the product.

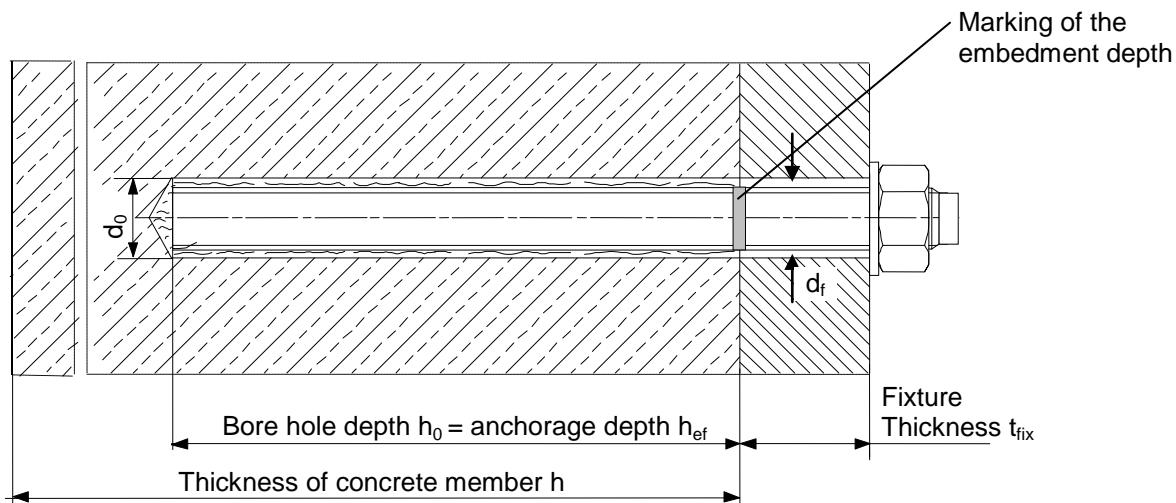

Working time, Curing time

Temperature of the base material T_{BM}	Working time t_{gel}	Curing time $t_{cure}^a)$
-5 °C ≤ T_{BM} < 0 °C	60 min	6 h
0 °C ≤ T_{BM} < 5 °C	40 min	3 h
5 °C ≤ T_{BM} < 10 °C	25 min	2 h
10 °C ≤ T_{BM} < 20 °C	10 min	90 min
20 °C ≤ T_{BM} < 30 °C	4 min	75 min
30 °C ≤ T_{BM} ≤ 40 °C	2 min	60 min

a) The curing time data are valid for dry anchorage base only. For water saturated anchorage bases the curing times must be doubled.

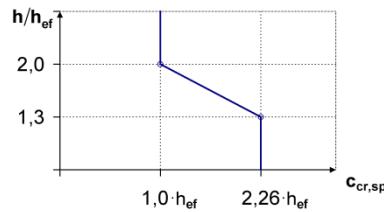

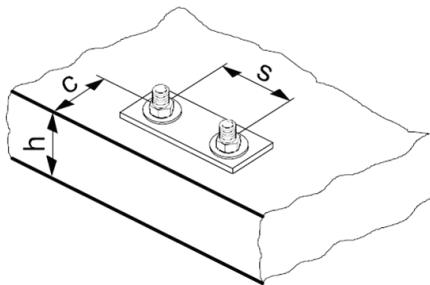

Setting
installation equipment

Anchor size	M8	M10	M12	M16	M20	M24
Rotary hammer			TE 2 – TE 16			TE 40 – TE 70
Other tools				compressed air gun or blow out pump, set of cleaning brushes, dispenser		

Setting details

Setting details

Anchor size	M8	M10	M12	M16	M20	M24	
Nominal diameter of drill bit	d_0 [mm]	10	12	14	18	22	28
Effective embedment and drill hole depth range ^{a)} for HIT-V	$h_{\text{ef,min}}$ [mm] $h_{\text{ef,max}}$ [mm]	64 96	80 120	96 144	128 192	160 240	192 288
Minimum base material thickness	h_{min} [mm]	$h_{\text{ef}} + 30 \text{ mm}$ $\geq 100 \text{ mm}$			$h_{\text{ef}} + 2 d_0$		
Diameter of clearance hole in the fixture	d_f [mm]	9	12	14	18	22	26
Torque moment	T_{\max} ^{b)} [Nm]	10	20	40	80	150	200
Minimum spacing	s_{\min} [mm]	40	50	60	80	100	120
Minimum edge distance	c_{\min} [mm]	40	50	60	80	100	120
Critical spacing for splitting failure	$s_{\text{cr,sp}}$ [mm]	2 $c_{\text{cr,sp}}$					
Critical edge distance for splitting failure ^{c)}	$c_{\text{cr,sp}}$ [mm]	$1,0 \cdot h_{\text{ef}}$ for $h / h_{\text{ef}} \geq 2,0$ $4,6 h_{\text{ef}} - 1,8 h$ for $2,0 > h / h_{\text{ef}} > 1,3:$ $2,26 h_{\text{ef}}$ for $h / h_{\text{ef}} \leq 1,3:$					
Critical spacing for concrete cone failure	$s_{\text{cr,N}}$ [mm]	2 $c_{\text{cr,N}}$					
Critical edge distance for concrete cone failure ^{d)}	$c_{\text{cr,N}}$ [mm]	1,5 h_{ef}					

For spacing (or edge distance) smaller than critical spacing (or critical edge distance) the design loads have to be reduced.

- a) Embedment depth range: $h_{\text{ef,min}} \leq h_{\text{ef}} \leq h_{\text{ef,max}}$
- b) Maximum recommended torque moment to avoid splitting failure during installation with minimum spacing and/or edge distance.
- c) h : base material thickness ($h \geq h_{\min}$), h_{ef} : embedment depth
- d) The critical edge distance for concrete cone failure depends on the embedment depth h_{ef} and the design bond resistance. The simplified formula given in this table is on the save side.

Simplified design method

Simplified version of the design method according ETAG 001, TR 029. Design resistance according data given in ETA-08/0341, issue 2008-12-02.

- Influence of concrete strength
- Influence of edge distance
- Influence of spacing
- Valid for a group of two anchors. (The method may also be applied for anchor groups with more than two anchors or more than one edge distance. The influencing factors must then be considered for each edge distance and spacing. The calculated design loads are then on the save side: They will be lower than the exact values according ETAG 001, TR 029. To avoid this, it is recommended to use the anchor design software PROFIS anchor)

The design method is based on the following simplification:

- No different loads are acting on individual anchors (no eccentricity)

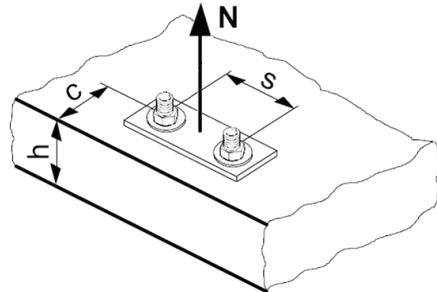

The values are valid for one anchor.

For more complex fastening applications please use the anchor design software PROFIS Anchor.

Tension loading

The design tensile resistance is the lower value of

- Steel resistance: $N_{Rd,s}$
- Combined pull-out and concrete cone resistance: $N_{Rd,p} = N_{Rd,p}^0 \cdot f_{B,p} \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,p} \cdot f_{re,N}$
- Concrete cone resistance: $N_{Rd,c} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,N} \cdot f_{re,N}$
- Concrete splitting resistance (only non-cracked concrete): $N_{Rd,sp} = N_{Rd,sp}^0 \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,N} \cdot f_{re,N}$

Basic design tensile resistance

Design steel resistance $N_{Rd,s}$

Anchor size	M8	M10	M12	M16	M20	M24
$N_{Rd,s}$	HIT-V(-F) 5,8 [kN]	12,0	19,3	28,0	52,7	82,0
	HIT-V(-F) 8,8 [kN]	19,3	30,7	44,7	84,0	130,7
	HIT-V-R [kN]	13,9	21,9	31,6	58,8	92,0
	HIT-V-HCR [kN]	19,3	30,7	44,7	84,0	130,7

Design combined pull-out and concrete cone resistance

$$N_{Rd,p} = N_{Rd,p}^0 \cdot f_{B,p} \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,p} \cdot f_{re,N}$$

Anchor size	M8	M10	M12	M16	M20	M24
Typical embedment depth $h_{ef} = h_{ef,typ}$ [mm]	80	90	110	130	170	210
$N_{Rd,p}^0$ Temperature range I [kN]	13,4	17,3	25,3	36,3	56,4	79,2
$N_{Rd,p}^0$ Temperature range II [kN]	12,3	17,3	23,0	34,5	53,4	74,8

Design concrete cone resistance $N_{Rd,c} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,N} \cdot f_{re,N}$

Design splitting resistance $N_{Rd,sp} = N_{Rd,sp}^0 \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,N} \cdot f_{re,N}$

Anchor size	M8	M10	M12	M16	M20	M24
$N_{Rd,c}^0$ [kN]	20,1	24,0	32,4	41,6	62,2	85,4

Influencing factors

Influence of concrete strength on combined pull-out and concrete cone resistance

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_{B,p} = (f_{ck,cube}/25N/mm^2)^{0,15}$ a)	1,00	1,03	1,06	1,09	1,11	1,13	1,14

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of embedment depth on combined pull-out and concrete cone resistance

$$f_{h,p} = h_{ef}/h_{ef,typ}$$

Influence of concrete strength on concrete cone resistance

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25N/mm^2)^{0,5}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of edge distance ^{a)}

c/c _{cr,N}	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
c/c _{cr,sp}										
$f_{1,N} = 0,7 + 0,3 \cdot c/c_{cr,N} \leq 1$	0,73	0,76	0,79	0,82	0,85	0,88	0,91	0,94	0,97	1
$f_{1,sp} = 0,7 + 0,3 \cdot c/c_{cr,sp} \leq 1$										
$f_{2,N} = 0,5 \cdot (1 + c/c_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{2,sp} = 0,5 \cdot (1 + c/c_{cr,sp}) \leq 1$										

a) The edge distance shall not be smaller than the minimum edge distance c_{min} . These influencing factors must be considered for every edge distance smaller than the critical edge distance.

Influence of anchor spacing ^{a)}

s/s _{cr,N}	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
s/s _{cr,sp}										
$f_{3,N} = 0,5 \cdot (1 + s/s_{cr,N}) \leq 1$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{3,sp} = 0,5 \cdot (1 + s/s_{cr,sp}) \leq 1$										

a) The anchor spacing shall not be smaller than the minimum anchor spacing s_{min} . This influencing factor must be considered for every anchor spacing.

Influence of embedment depth on concrete cone resistance

$$f_{h,N} = (h_{ef}/h_{ef,typ})^{1,5}$$

Influence of reinforcement

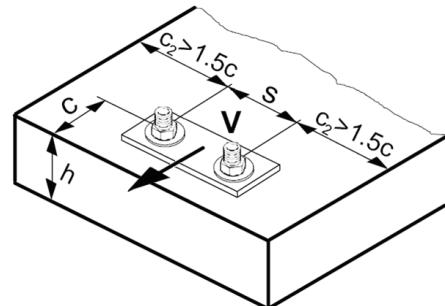

h _{ef} [mm]	40	50	60	70	80	90	≥ 100
$f_{re,N} = 0,5 + h_{ef}/200mm \leq 1$	0,7 ^{a)}	0,75 ^{a)}	0,8 ^{a)}	0,85 ^{a)}	0,9 ^{a)}	0,95 ^{a)}	1

a) This factor applies only for dense reinforcement. If in the area of anchorage there is reinforcement with a spacing ≥ 150 mm (any diameter) or with a diameter ≤ 10 mm and a spacing ≥ 100 mm, then a factor $f_{re,N} = 1$ may be applied.

Shear loading

The design shear resistance is the lower value of

- Steel resistance: $V_{Rd,s}$
- Concrete prout resistance: $V_{Rd,cp} = k \cdot \text{lower value of } N_{Rd,p} \text{ and } N_{Rd,c}$
- Concrete edge resistance: $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_\beta \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Basic design shear resistance

Design steel resistance $V_{Rd,s}$

Anchor size	M8	M10	M12	M16	M20	M24
$V_{Rd,s}$	HIT-V(-F) 5,8 [kN]	7,2	12,0	16,8	31,2	48,8

	HIT-V(-F) 5.8 HIT-V(-F) 8.8 HIT-V-R HIT-V-HCR	[kN]	5,1 8,6 5,9 8,6	8,6 13,1 9,1 13,1	12,0 19,1 13,7 19,1	22,3 30,9 25,2 30,9	34,9 45,8 39,4 45,8	50,3 62,5 56,8 50,6

For the recommended loads an overall partial safety factor for action $\gamma = 1,4$ is considered. The partial safety factors for action depend on the type of loading and shall be taken from national regulations. According ETAG 001, annex C, the partial safety factor is $\gamma_G = 1,35$ for permanent actions and $\gamma_Q = 1,5$ for variable actions.

For the recommended loads an overall partial safety factor for action $\gamma = 1,4$ is considered. The partial safety factors for action depend on the type of loading and shall be taken from national regulations. According ETAG 001, annex C, the partial safety factor is $\gamma_G = 1,35$ for permanent actions and $\gamma_Q = 1,5$ for variable actions.

Recommended loads: non-cracked concrete C 20/25 - embedment depth = 12 d^{a)}

Basic loading data (for a single anchor)

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Steel failure
- Base material thickness, as specified in the table
- One typical embedment depth, as specified in the table
- One anchor material, as specified in the tables
- Concrete C 20/25, $f_{ck,cube} = 25 \text{ N/mm}^2$
- Installation temperature range -18°C to +32°C

For details see Simplified design method

Embedment depth ^{a)} and base material thickness for the basic loading data. Mean ultimate resistance, characteristic resistance, design resistance, recommended loads.

Anchor size	M8	M10	M12	M16	M20	M24
Embedment depth [mm]	80	90	110	125	170	210
Base material thickness [mm]	110	120	140	165	220	270

a) The allowed range of embedment depth is shown in the setting details. The corresponding load values can be calculated according to the simplified design method.

Mean ultimate resistance: concrete C 20/25 – $f_{ck,cube} = 25 \text{ N/mm}^2$, anchor HIT-V 5.8

Anchor size	Hilti technical data					
	M8	M10	M12	M16	M20	M24

a) With overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Service temperature range

Hilti HIT-ICE injection mortar may be applied in the temperature range given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

Temperature range	Base material temperature	Maximum long term base material temperature	Maximum short term base material temperature
Temperature range I	-40 °C to +70 °C	+43 °C	+70 °C

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

Rotary hammer			TE 2 – TE 16			TE 40 – TE 50
Other tools						compressed air gun or blow out pump, set of cleaning brushes, dispenser

Setting instruction

Dry and water-saturated concrete, hammer drilling

a) Note: Manual cleaning for element sizes $d \leq 16\text{mm}$ and embedment depth $h_{ef} \leq 10d$ only!

Brush bore hole with required steel brush HIT-RB

For detailed information on installation see instruction for use given with the package of the product.

Curing time for general conditions

Hilti technical data		
Temperature of the base material	Curing time before anchor can be fully loaded t_{cure}	Working time in which anchor can be inserted and adjusted t_{gel}
32 °C	35 min	1 min
21 °C	45 min	2,5 min
16 °C	1 h	5 min
4 °C	1 ½ h	15 min
- 7 °C	6 h	1 h
- 18 °C	24 h	1,5 h
- 23 °C	36 h	1,5 h

Setting details

	Hilti technical data					
Anchor size	M8	M10	M12	M16	M20	M24
Nominal diameter of drill bit d_0 [mm]	10	12	14	18	24	28
Effective anchorage and drill hole depth h_{ef} [mm]	80	90	110	125	170	210
Minimum base material thickness ^{b)} h_{\min} [mm]	$h_{\text{ef}} + 30 \text{ mm}$ $\geq 100 \text{ mm}$			$h_{\text{ef}} + 2 d_0$		
Diameter of clearance hole in the fixture d_f [mm]	9	12	14	18	22	26
Minimum spacing s_{\min} [mm]	40	50	60	80	100	120
Minimum edge distance c_{\min} [mm]	40	50	60	80	100	120
Critical spacing for splitting failure $s_{\text{cr,sp}}$	$2 c_{\text{cr,sp}}$					
Critical edge distance for splitting failure ^{c)} $c_{\text{cr,sp}}$ [mm]	$1,0 \cdot h_{\text{ef}}$ for $h / h_{\text{ef}} \geq 2,0$					
	$4,6 h_{\text{ef}} - 1,8 h$ for $2,0 > h / h_{\text{ef}} > 1,3$					
	$2,26 h_{\text{ef}}$ for $h / h_{\text{ef}} \leq 1,3$					
Critical spacing for concrete cone failure $s_{\text{cr,N}}$	$2 c_{\text{cr,N}}$					
Critical edge distance for concrete cone failure ^{b)} $c_{\text{cr,N}}$	$1,5 h_{\text{ef}}$					
Torque moment ^{c)} T_{inst} [Nm]	10	20	40	80	150	200

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced.

- a) h : base material thickness ($h \geq h_{\min}$)
- b) The critical edge distance for concrete cone failure depends on the embedment depth h_{ef} and the design bond resistance. The simplified formula given in this table is on the save side.
- c) This is the maximum recommended torque moment to avoid splitting failure during installation for anchors with minimum spacing and/or edge distance.

Simplified design method

Simplified version of the design method according ETAG 001, TR 029. Design resistance according data given by Hilti.

- Influence of concrete strength
- Influence of edge distance
- Influence of spacing
- Valid for a group of two anchors. (The method may also be applied for anchor groups with more than two anchors or more than one edge distance. The influencing factors must then be considered for each edge distance and spacing. The calculated design loads are then on the same side: They will be lower than the exact values according ETAG 001, TR 029. To avoid this, it is recommended to use the anchor design software PROFIS anchor)

The design method is based on the following simplification:

- No different loads are acting on individual anchors (no eccentricity)

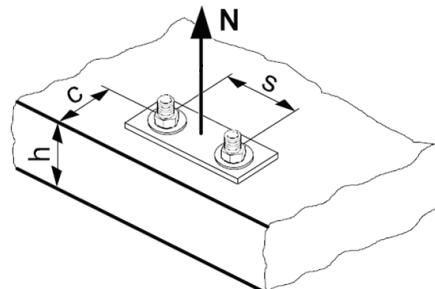

The values are valid for one anchor.

For more complex fastening applications please use the anchor design software PROFIS Anchor.

Tension loading

The design tensile resistance is the lower value of

- Steel resistance: $N_{Rd,s}$
- Combined pull-out and concrete cone resistance: $N_{Rd,p} = N^0_{Rd,p} \cdot f_{B,p} \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,p} \cdot f_{re,N}$
- Concrete cone resistance: $N_{Rd,c} = N^0_{Rd,c} \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,N} \cdot f_{re,N}$
- Concrete splitting resistance (only non-cracked concrete): $N_{Rd,sp} = N^0_{Rd,sp} \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,N} \cdot f_{re,N}$

Basic design tensile resistance

Design steel resistance $N_{Rd,s}$

Anchor size	Hilti technical data

Influencing factors

Influence of concrete strength on combined pull-out and concrete cone resistance

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_{B,p} = (f_{ck,cube}/25N/mm^2)^{0,1}$ a)	1	1,02	1,04	1,06	1,07	1,08	1,09

 a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of embedment depth on combined pull-out and concrete cone resistance

$$f_{h,p} = 1$$

Influence of concrete strength on concrete cone resistance

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25N/mm^2)^{1/2}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

 a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of embedment depth on concrete cone resistance

$$f_{h,N} = 1$$

Influence of edge distance ^{a)}

$c/c_{cr,N}$	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$c/c_{cr,sp}$										
$f_{1,N} = 0,7 + 0,3 \cdot c/c_{cr,N}$	0,73	0,76	0,79	0,82	0,85	0,88	0,91	0,94	0,97	1
$f_{1,sp} = 0,7 + 0,3 \cdot c/c_{cr,sp}$										
$f_{2,N} = 0,5 \cdot (1 + c/c_{cr,N})$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{2,sp} = 0,5 \cdot (1 + c/c_{cr,sp})$										

 a) The the edge distance shall not be smaller than the minimum edge distance c_{min} given in the table with the setting details. These influencing factors must be considered for every edge distance smaller than the critical edge distance.

Influence of anchor spacing ^{a)}

$s/s_{cr,N}$	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$s/s_{cr,sp}$										
$f_{3,N} = 0,5 \cdot (1 + s/s_{cr,N})$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{3,sp} = 0,5 \cdot (1 + s/s_{cr,sp})$										

 a) The anchor spacing shall not be smaller than the minimum anchor spacing s_{min} given in the table with the setting details. This influencing factor must be considered for every anchor spacing.

Influence of reinforcement

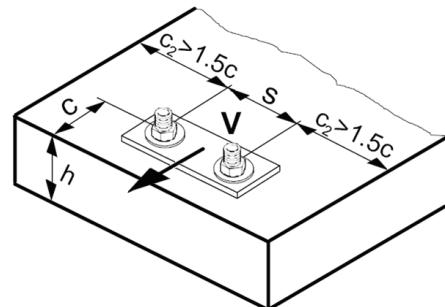

h_{ef} [mm]	80	90	≥ 100
$f_{re,N} = 0,5 + h_{ef}/200\text{mm} \leq 1$	0,9 ^{a)}	0,95 ^{a)}	1

- a) This factor applies only for dense reinforcement. If in the area of anchorage there is reinforcement with a spacing ≥ 150 mm (any diameter) or with a diameter ≤ 10 mm and a spacing ≥ 100 mm, then a factor $f_{re,N} = 1$ may be applied.

Shear loading

The design shear resistance is the lower value of

- Steel resistance: $V_{Rd,s}$
- Concrete prout resistance: $V_{Rd,cp} = k \cdot \text{lower value of } N_{Rd,p} \text{ and } N_{Rd,c}$
- Concrete edge resistance: $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_B \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Basic design shear resistance

Design steel resistance $V_{Rd,s}$

a) The anchor spacing and the edge distance shall not be smaller than the minimum anchor spacing s_{min} and the minimum edge distance c_{min} .

Influence of embedment depth

Anchor size	M8	M10	M12	M16	M20	M24
$f_{hef} = 0,05 \cdot (h_{ef} / d)^{1,68}$	2,39	2	2,07	1,58	1,82	1,91

Influence of edge distance ^{a)}

c/d	4	6	8	10	15	20	30	40
$f_c = (d / c)^{0,19}$	0,77	0,71	0,67	0,65	0,60	0,57	0,52	0,50

a) The edge distance shall not be smaller than the minimum edge distance c_{min} .

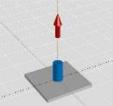

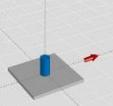

Combined tension and shear loading

For combined tension and shear loading see section "Anchor Design".

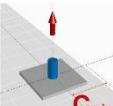

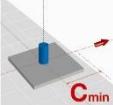

Precalculated values

Recommended loads can be calculated by dividing the design resistance by an overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Basic loading data (for a single anchor)

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Steel failure
- Screw strength class 8.8
- Base material thickness, as specified in the table
- Embedment depth, as specified in the table
- One anchor material, as specified in the tables
- Concrete C 20/25, $f_{ck,cube} = 25 \text{ N/mm}^2$
- Installation temperature range -18°C to +32°C

For details see Simplified design method

Embedment depth and base material thickness for the basic loading data. Mean ultimate resistance, characteristic resistance, design resistance, recommended loads.

Anchor size	M8	M10	M12	M16	M20
Embedment depth [mm]	90	110	125	170	205
Base material thickness [mm]	120	150	170	230	270

Mean ultimate resistance ^{a)}: concrete C 20/25 – $f_{ck,cube} = 25 \text{ N/mm}^2$, anchor HIS-N

		Hilti technical data

a) With overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Service temperature range

Hilti HIT-ICE injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

Temperature range	Base material temperature	Maximum long term base material temperature	Maximum short term base material temperature
Temperature range I	-40 °C to +70 °C	+43 °C	+70 °C

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

Critical spacing for concrete cone failure $s_{\text{cr,N}}$	2 $c_{\text{cr,N}}$				
Critical edge distance for concrete cone failure $c_{\text{cr,N}}$ ^{b)}	1.5 h_{ef}				
Torque moment ^{c)} T_{inst} [Nm]	10	20	40	80	150

h/h_{ef}	$c_{\text{cr,sp}}$ [mm]	$2 c_{\text{cr,sp}}$ [mm]
1,0	1,0	2,0
2,0	2,0	4,0
2,26	2,26	4,52

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced.

- a) h : base material thickness ($h \geq h_{\min}$)
- b) The critical edge distance for concrete cone failure depends on the embedment depth h_{ef} and the design bond resistance. The simplified formula given in this table is on the save side.
- c) This is the maximum recommended torque moment to avoid splitting failure during installation for anchors with minimum spacing and/or edge distance.

Simplified design method

Simplified version of the design method according ETAG 001, TR 029. Design resistance according data given by Hilti.

- Influence of concrete strength
- Influence of edge distance
- Influence of spacing
- Valid for a group of two anchors. (The method may also be applied for anchor groups with more than two anchors or more than one edge distance. The influencing factors must then be considered for each edge distance and spacing. The calculated design loads are then on the same side: They will be lower than the exact values according ETAG 001, TR 029. To avoid this, it is recommended to use the anchor design software PROFIS anchor)

The design method is based on the following simplification:

- No different loads are acting on individual anchors (no eccentricity)

The values are valid for one anchor.

For more complex fastening applications please use the anchor design software PROFIS Anchor.

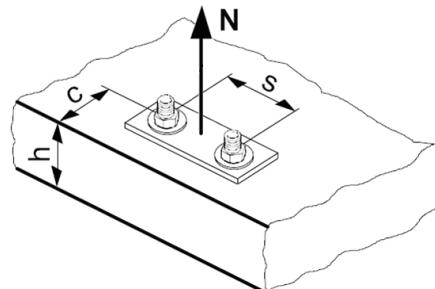

Tension loading

The design tensile resistance is the lower value of

- Steel resistance: $N_{Rd,s}$
- Combined pull-out and concrete cone resistance:

$$N_{Rd,p} = N_{Rd,p}^0 \cdot f_{B,p} \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,p} \cdot f_{re,N}$$
- Concrete cone resistance: $N_{Rd,c} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,N} \cdot f_{re,N}$
- Concrete splitting resistance (only non-cracked concrete):

$$N_{Rd,sp} = N_{Rd,sp}^0 \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,N} \cdot f_{re,N}$$

Basic design tensile resistance

$N_{Rd,c}^0$ [kN]	20,5	27,7	33,6	53,3	70,6

Influencing factors

Influence of concrete strength on combined pull-out and concrete cone resistance

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_{B,p} = (f_{ck,cube}/25N/mm^2)^{0,1}$ a)	1	1,02	1,04	1,06	1,07	1,08	1,09

 a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of embedment depth on combined pull-out and concrete cone resistance

$$f_{h,p} = 1$$

Influence of concrete strength on concrete cone resistance

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25N/mm^2)^{1/2}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

 a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of edge distance a)

$c/c_{cr,N}$	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$f_{1,N} = 0,7 + 0,3 \cdot c/c_{cr,N}$	0,73	0,76	0,79	0,82	0,85	0,88	0,91	0,94	0,97	1
$f_{1,sp} = 0,7 + 0,3 \cdot c/c_{cr,sp}$										
$f_{2,N} = 0,5 \cdot (1 + c/c_{cr,N})$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{2,sp} = 0,5 \cdot (1 + c/c_{cr,sp})$										

 a) The edge distance shall not be smaller than the minimum edge distance c_{min} given in the table with the setting details. These influencing factors must be considered for every edge distance smaller than the critical edge distance.

Influence of anchor spacing a)

$s/s_{cr,N}$	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
$s/s_{cr,sp}$										
$f_{3,N} = 0,5 \cdot (1 + s/s_{cr,N})$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{3,sp} = 0,5 \cdot (1 + s/s_{cr,sp})$										

 a) The anchor spacing shall not be smaller than the minimum anchor spacing s_{min} given in the table with the setting details. This influencing factor must be considered for every anchor spacing.

Influence of embedment depth on concrete cone resistance

$$f_{h,N} = 1$$

Influence of reinforcement

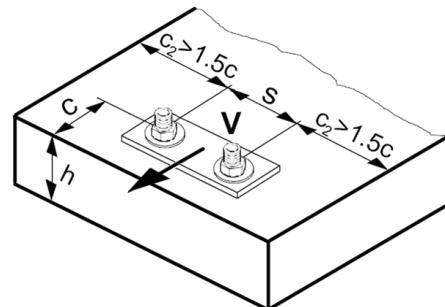

h_{ef} [mm]	80	90	≥ 100
$f_{re,N} = 0.5 + h_{ef}/200\text{mm} \leq 1$	0.9 ^{a)}	0.95 ^{a)}	1

a) This factor applies only for dense reinforcement. If in the area of anchorage there is reinforcement with a spacing ≥ 150 mm (any diameter) or with a diameter ≤ 10 mm and a spacing ≥ 100 mm, then a factor $f_{re,N} = 1$ may be applied.

Shear loading

The design shear resistance is the lower value of

- Steel resistance: $V_{Rd,s}$
- Concrete prout resistance: $V_{Rd,cp} = k \cdot \text{lower value of } N_{Rd,p} \text{ and } N_{Rd,c}$
- Concrete edge resistance: $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_B \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Basic design shear resistance

Design steel resistance $V_{Rd,s}$

Anchor size	Hilti technical data				
	M8	M10	M12	M16	M20
V _{Rd,s} HIS-N [kN]	10,4	18,4	26,0	39,3	36,7
V _{Rd,s} HIS-RN [kN]	8,3	12,8	19,2	35,3	41,5

Design concrete prout resistance $V_{Rd,cp} = \text{lower value } ^a) \text{ of } k \cdot N_{Rd,p} \text{ and } k \cdot N_{Rd,c}$

$k = 1$ for $h_{ef} < 60$ mm

$k = 2$ for $h_{ef} \geq 60$ mm

- a) $N_{Rd,p}$: Design combined pull-out and concrete cone resistance
 $N_{Rd,c}$: Design concrete cone resistance

Design concrete edge resistance $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_B \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Anchor size	M8	M10	M12	M16	M20
Non-cracked concrete					
$V_{Rd,c}^0$ [kN]	12,4	19,6	28,2	40,2	46,2

Influencing factors

Influence of concrete strength

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25\text{N/mm}^2)^{1/2}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of angle between load applied and the direction perpendicular to the free edge

Angle β	0°	10°	20°	30°	40°	50°	60°	70°	80°	$\geq 90^\circ$
$f_\beta = \sqrt{\frac{1}{(\cos \alpha_v)^2 + \left(\frac{\sin \alpha_v}{2,5}\right)^2}}$	1	1,01	1,05	1,13	1,24	1,40	1,64	1,97	2,32	2,50

a) The anchor spacing and the edge distance shall not be smaller than the minimum anchor spacing s_{min} and the minimum edge distance c_{min} .

Influence of embedment depth

Anchor size	M8	M10	M12	M16	M20
$f_{hef} =$	1,38	1,21	1,04	1,22	1,45

Influence of edge distance ^{a)}

c/d	4	6	8	10	15	20	30	40
$f_c = (d / c)^{0,19}$	0,77	0,71	0,67	0,65	0,60	0,57	0,52	0,50

a) The edge distance shall not be smaller than the minimum edge distance c_{min} .

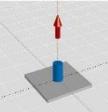

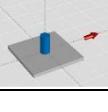

Combined tension and shear loading

For combined tension and shear loading see section "Anchor Design".

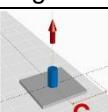

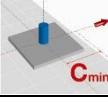

Precalculated values

Recommended loads can be calculated by dividing the design resistance by an overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Hilti HIT-ICE mortar with rebar (as anchor)

Injection mortar system	Benefits
  	<p>Hilti HIT-ICE 296 ml cartridge</p> <p>Statik mixer</p> <p>rebar BSt 500 S</p> <ul style="list-style-type: none"> - suitable for non-cracked concrete C 20/25 to C 50/60 - high loading capacity - suitable for dry and water saturated concrete - high corrosion resistant - odourless resin - low installation temperature (range -23 °C – 32 °C)

Concrete Small edge distance and spacing Variable embedment depth PROFIS Anchor design software

Basic loading data (for a single anchor)

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Steel failure
- Base material thickness, as specified in the table
- One typical embedment depth, as specified in the table
- One anchor material, as specified in the tables
- Concrete C 20/25, $f_{ck,cube} = 25 \text{ N/mm}^2$
- Installation temperature range -18°C to +32°C

For details see Simplified design method

Embedment depth ^{a)} and base material thickness for the basic loading data. Mean ultimate resistance, characteristic resistance, design resistance, recommended loads.

Anchor size	Hilti technical data						
	Ø8	Ø10	Ø12	Ø14	Ø16	Ø20	Ø25
Typical embedment depth [mm]	80	90	110	125	125	170	210
Base material thickness [mm]	110	120	145	165	165	220	275

a) The allowed range of embedment depth is shown in the setting details. The corresponding load values can be calculated according to the simplified design method.

a) With overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Service temperature range

Hilti HIT-ICE injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

Temperature range	Base material temperature	Maximum long term base material temperature	Maximum short term base material temperature
Temperature range I	-40 °C to +40 °C	+43 °C	+70 °C

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

Materials

Other tools							compressed air gun or blow out pump, set of cleaning brushes, dispenser

Setting instruction

Dry and water-saturated concrete, hammer drilling

a) Note: Manual cleaning for element sizes $d \leq 16\text{mm}$ and embedment depth $h_{ef} \leq 10d$ only!

Brush bore hole with required steel brush HIT-RB

For detailed information on installation see instruction for use given with the package of the product.

Curing time for general conditions

Hilti technical data		
Temperature of the base material	Curing time before anchor can be fully loaded t_{cure}	Working time in which anchor can be inserted and adjusted t_{gel}
32 °C	35 min	1 min
21 °C	45 min	2,5 min
16 °C	1 h	5 min
4 °C	1 ½ h	15 min
- 7 °C	6 h	1 h
- 18 °C	24 h	1,5 h
- 23 °C	36 h	1,5 h

Setting details

	Hilti technical data							
Anchor size	Ø8	Ø10	Ø12	Ø14	Ø16	Ø20	Ø25	
Nominal diameter of drill bit d_0 [mm]	12	14	16	18	20	25	32	
Effective anchorage and drill hole depth h_{ef} [mm]	80	90	110	125	125	170	210	
Minimum base material thickness ^{a)} h_{min} [mm]	$h_{ef} + 30 \text{ mm}$ $\geq 100 \text{ mm}$						$h_{ef} + 2 d_0$	
Minimum spacing s_{min} [mm]	40	50	60	70	80	100	125	
Minimum edge distance c_{min} [mm]	40	50	60	70	80	100	125	
Critical spacing for splitting failure $s_{cr,sp}$	$2 c_{cr,sp}$							
Critical edge distance for splitting failure ^{b)} $c_{cr,sp}$ [mm]	$1,0 \cdot h_{ef}$ for $h / h_{ef} \geq 2,0$							
	$4,6 h_{ef} - 1,8 h$ for $2,0 > h / h_{ef} > 1,3$							
	$2,26 h_{ef}$ for $h / h_{ef} \leq 1,3$							
Critical spacing for concrete cone failure $s_{cr,N}$	$2 c_{cr,N}$							
Critical edge distance for concrete cone failure ^{c)} $c_{cr,N}$	$1,5 h_{ef}$							

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced.

- a) h : base material thickness ($h \geq h_{min}$)
- b) The critical edge distance for concrete cone failure depends on the embedment depth h_{ef} and the design bond resistance. The simplified formula given in this table is on the save side.

Simplified design method

Simplified version of the design method according ETAG 001, TR 029. Design resistance according data given by Hilti.

- Influence of concrete strength
- Influence of edge distance
- Influence of spacing
- Valid for a group of two anchors. (The method may also be applied for anchor groups with more than two anchors or more than one edge distance. The influencing factors must then be considered for each edge distance and spacing. The calculated design loads are then on the same side: They will be lower than the exact values according ETAG 001, TR 029. To avoid this, it is recommended to use the anchor design software PROFIS anchor)

The design method is based on the following simplification:

- No different loads are acting on individual anchors (no eccentricity)

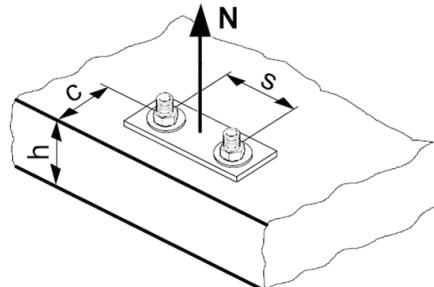

The values are valid for one anchor.

For more complex fastening applications please use the anchor design software PROFIS Anchor.

Tension loading

The design tensile resistance is the lower value of

- Steel resistance: $N_{Rd,s}$
- Combined pull-out and concrete cone resistance: $N_{Rd,p} = N^0_{Rd,p} \cdot f_{B,p} \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,p} \cdot f_{re,N}$
- Concrete cone resistance: $N_{Rd,c} = N^0_{Rd,c} \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,N} \cdot f_{re,N}$
- Concrete splitting resistance (only non-cracked concrete): $N_{Rd,sp} = N^0_{Rd,sp} \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,N} \cdot f_{re,N}$

Basic design tensile resistance

Influencing factors

Influence of concrete strength on combined pull-out and concrete cone resistance

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_{B,p} = (f_{ck,cube}/25N/mm^2)^{0,1}$ a)	1	1,02	1,04	1,06	1,07	1,08	1,09

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of embedment depth on combined pull-out and concrete cone resistance

$$f_{h,p} = 1$$

Influence of concrete strength on concrete cone resistance

Concrete strength designation (ENV 206)	C 20/25	C 25/30	C 30/37	C 35/45	C 40/50	C 45/55	C 50/60
$f_B = (f_{ck,cube}/25N/mm^2)^{1/2}$ a)	1	1,1	1,22	1,34	1,41	1,48	1,55

a) $f_{ck,cube}$ = concrete compressive strength, measured on cubes with 150 mm side length

Influence of embedment depth on concrete cone resistance

$$f_{h,N} = 1$$

Influence of edge distance ^{a)}

c/c _{cr,N}	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
c/c _{cr,sp}										
$f_{1,N} = 0,7 + 0,3 \cdot c/c_{cr,N}$	0,73	0,76	0,79	0,82	0,85	0,88	0,91	0,94	0,97	1
$f_{1,sp} = 0,7 + 0,3 \cdot c/c_{cr,sp}$										
$f_{2,N} = 0,5 \cdot (1 + c/c_{cr,N})$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{2,sp} = 0,5 \cdot (1 + c/c_{cr,sp})$										

a) The the edge distance shall not be smaller than the minimum edge distance c_{min} given in the table with the setting details. These influencing factors must be considered for every edge distance smaller than the critical edge distance.

Influence of anchor spacing ^{a)}

s/s _{cr,N}	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8	0,9	1
s/s _{cr,sp}										
$f_{3,N} = 0,5 \cdot (1 + s/s_{cr,N})$	0,55	0,60	0,65	0,70	0,75	0,80	0,85	0,90	0,95	1
$f_{3,sp} = 0,5 \cdot (1 + s/s_{cr,sp})$										

a) The anchor spacing shall not be smaller than the minimum anchor spacing s_{min} given in the table with the setting details. This influencing factor must be considered for every anchor spacing.

Influence of reinforcement

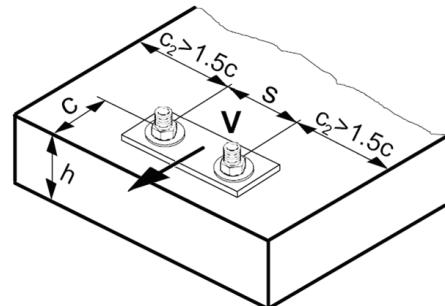

h _{ef} [mm]	80	90	≥ 100
$f_{re,N} = 0,5 + h_{ef}/200mm \leq 1$	0,9 ^{a)}	0,95 ^{a)}	1

a) This factor applies only for dense reinforcement. If in the area of anchorage there is reinforcement with a spacing ≥ 150 mm (any diameter) or with a diameter ≤ 10 mm and a spacing ≥ 100 mm, then a factor $f_{re,N} = 1$ may be applied.

Shear loading

The design shear resistance is the lower value of

- Steel resistance: $V_{Rd,s}$
- Concrete prout resistance: $V_{Rd,cp} = k \cdot \text{lower value of } N_{Rd,p} \text{ and } N_{Rd,c}$
- Concrete edge resistance: $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_B \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

Basic design shear resistance

Combined tension and shear loading

For combined tension and shear loading see section "Anchor Design".

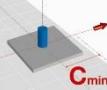

Precalculated values

Recommended loads can be calculated by dividing the design resistance by an overall partial safety factor for action $\gamma = 1,4$. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

1 Basics of post installed rebar connections

1.1 Definition of rebar

Reinforcement anchorages or splices that are fixed into already cured concrete by Hilti HIT injection adhesives in drilled holes are called “Post-installed rebar connections” as opposed to normal, so called “cast-in” reinforcement. Many connections of rebars installed for good detailing practice will not require specific design considerations. But post-installed rebars which become part of the structural system have to be designed as carefully as the entire structure. While European Technical Approvals prove that in basic load situations, post-installed rebars behave like cast-in bars, a number of differences needs to be considered in special design situations such as fire or load cases where hooks or bends would be required for cast-in anchorages. The following chapters are intended to give the necessary information to safely design and specify post-installed reinforcement connections.

structural rebar situations: “anchorage node in equilibrium” and “splice”

anchor situation

This section of the Fastening Technology Manual deals with reinforcement connections designed according to structural reinforced concrete design principles. The task of structural rebars is to take tensile loads and since concrete failure is always brittle, reinforced concrete design assumes that concrete has no tensile strength. Therefore structural rebars can end / be anchored in only two situations:

- the bar is not needed anymore (the anchorage is a node in equilibrium without tensile stress in concrete)
- another bar takes over the tensile load (overlap splice)

Situations where the concrete needs to take up tensile load from the anchorage or where rebars are designed to carry shear loads should be considered as “rebar used as anchors” and designed according to anchor design principles as given e.g. in the guidelines of EOTA [3]

Unlike in anchor applications, reinforcement design is normally done for yielding of the steel in order to obtain ductile behaviour of the structure with a good serviceability. The deformations are rather small in correlation to the loads and the crack width limitation is around $w_k \sim 0.3\text{mm}$. This is an important factor when considering resistance to the environment, mainly corrosion of the reinforcement.

In case of correct design and installation the structure can be assumed as monolithic which allows us to look at the situation as if the concrete was poured in one. Due to the allowed high loads the required embedment depth can be up to 80d (diameter of rebar).

1.2 Advantages of post-installed rebar connections

With the use of the Hilti HIT injection systems it is possible to connect new reinforcement to existing structures with maximum confidence and flexibility.

- **design flexibility**
- **form work simplification**
- **reliable like cast in**
- **defined load characteristics**
- **horizontal, vertical and overhead**
- **simple, high confidence application**

1.3 Application examples

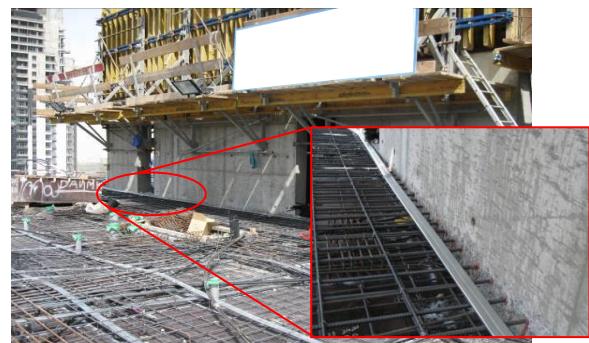

Post installed rebar connections are used in a wide range of applications, which vary from new construction projects, to structure upgrades and infrastructure requalifications.

Post-installed rebar connections in new construction projects

Post-installed rebar connections in structure upgrades

Wall strengthening

New slab constructions

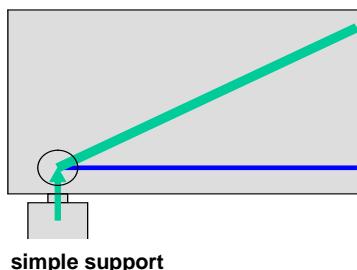

Joint strengthening**Cantilevers/balconies**

Post-installed rebar connections in infrastructure requalifications

Slab widening**Structural upgrade****Slab strengthening****Sidewalk upgrade**

1.4 Anchorage and Splice

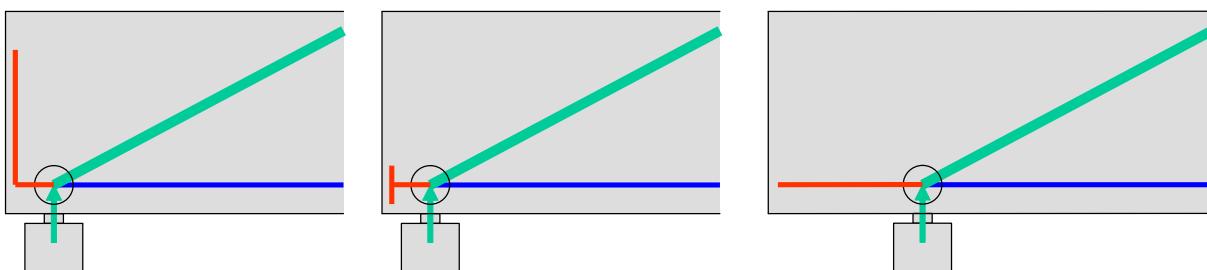

Development Length

simple support

Reinforced concrete is often designed using strut and tie models. The forces are represented by trusses and the nodes of these trusses have to be in equilibrium like in the figure to the left: the concrete compression force (green line), the support force (green arrow) and the steel tensile force (blue). The model assumes that the reinforcing bar can provide its tensile force on the right side of the node while there is no steel stress at all on the left side, i.e. the bar is not needed any more on the left side of the node. Physically this is not possible, the strut and tie model is an idealization. The steel stress has to be developed on the left side of the node. This is operated by bond between steel and concrete. For the bar to be able to develop stress it needs to be extended on the left side of the node. This extension is called "development length" or "anchorage length". The space on the

left side of the node shown in the figure above is not enough to allow a sufficient development of steel stress by bond. Possible approaches to solve this problem are shown in the figure below: either an extension of the concrete section over the support or a reduction of the development length with appropriate methods. Typical solutions are hooks, heads, welded transverse reinforcement or external anchorage.

Typical solutions for anchoring of the reinforcement

Overlap Splices

Overlap splices

In case that the equilibrium of a node cannot be established without using the tensile capacity of the concrete, the tensile force of a (ending) bar must be transmitted to other reinforcement bars. A common example is starter bars for columns or walls. Due to practical reasons foundations are often built with rebars much shorter than the final column height, sticking out of the concrete. The column reinforcement will later be spliced with these. The resulting tension load in the column reinforcement due to bending on the column will be transferred into the starter bars through an overlap splice.

Forces are transmitted from one bar to another by lapping the bars. The detailing of laps between bars shall be such that:

- the transmission of the forces from one bar to the next is assured
- spalling of the concrete in the neighbourhood of the joints does not occur
- large cracks which affect the performance of the structure do not develop

1.5 Bond of Cast-in Ribbed Bars

General Behaviour

For ribbed bars, the load transfer in concrete is governed by the bearing of the ribs against the concrete. The reacting force within the concrete is assumed to be a compressive strut with an angle of 45°.

For higher bond stress values, the concentrated bearing forces in front of the ribs cause the formation of cone-shaped cracks starting at the crest of the ribs. The resulting concrete keyed between the ribs transfer the bearing forces into the surrounding concrete, but the wedging action of the ribs remains limited. In this stage the displacement of the bar with respect to the concrete (slip) consists of bending of the keys and crushing of the concrete in front of the ribs.

The bearing forces, which are inclined with respect to the bar axis, can be decomposed into directions parallel and perpendicular to the bar axis. The sum of the parallel components equals the bond force, whereas the radial components induce circumferential tensile stresses in the surrounding concrete, which may result in longitudinal radial (splitting / spalling) cracks. Two failure modes can be considered:

Bond Failure

Bond failure is caused by pull-out of the bar if the confinement (concrete cover, transverse reinforcement) is sufficient to prevent splitting of the concrete cover. In that case the concrete keys are sheared off and a sliding plane around the bar is created. Thus, the force transfer mechanism changes from rib bearing to friction. The shear resistance of the keys can be considered as a criterion for this transition. It is attended by a considerable reduction of the bond stress. Under continued loading, the sliding surface is smoothed due to wear and compaction, which will result in a further decrease of the bond stress, similar to the case of plain bars.

Splitting failure:

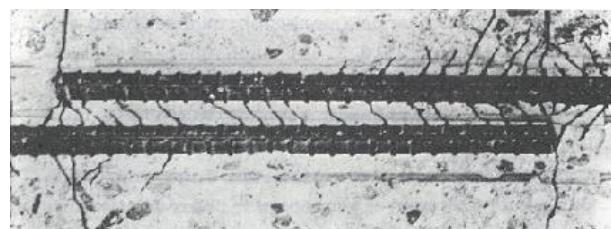

Bond splitting failure is decisive if the radial cracks propagate through the entire cover. In that case the maximum bond stress follows from the maximum concrete confinement, which is reached when the radial cracks have penetrated the cover for about 70%. Further crack propagation results in a decrease of the confining stresses. At reaching the outer surface these stresses are strongly reduced, which results in a sudden drop of the bond stress.

Influence of spacing and cover on splitting and spalling of concrete

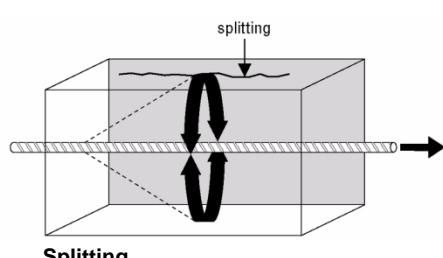

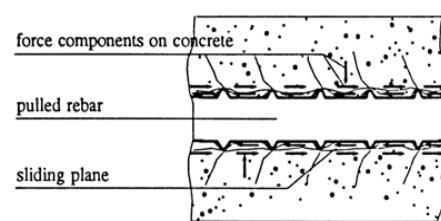

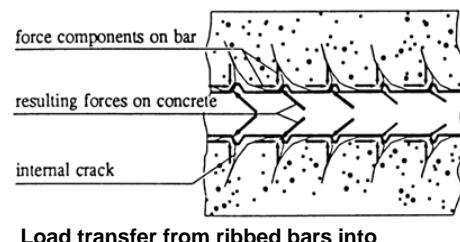

In most cases the reinforcement bars are placed close to the surface of the concrete member to achieve good crack distribution and economical bending capacity. For splices at wide spacing (normally in slabs, left part of figure left), the bearing capacity of the concrete depends only on the thickness of the concrete cover. At narrow spacing (normally in beams, right part of figure above) the bearing capacity depends on the spacing and on the thickness of the cover. In the design codes the reduction of bearing capacity of the cover is taken into account by means of multiplying factors for the splice length.

Load Transfer in Overlap Splices

Load transfer at lap splices

The load transfer between bars is performed by means of compressive struts in the concrete, see figure left. A 45° truss model is assumed. The resulting perpendicular forces act as splitting forces. The splitting forces are normally taken up by the transverse reinforcement. Small splitting forces are attributed to the tensile capacity of the concrete. The amount of the transverse or tie reinforcement necessary is specified in the design codes.

1.6 Specifics of Post-Installed Reinforcing Bars

General Behaviour

The load transfer for post-installed bars is similar to cast in bars if the stiffness of the overall load transfer mechanism is similar to the cast-in system. The efficiency depends on the strength of the adhesive mortar against the concentrated load near the ribs and on the capacity of load transfer at the interface of the drilled hole.

In many cases the bond values of post-installed bars are higher compared to cast in bars due to better performance of the adhesive mortar. But for small edge distance and/or narrow spacing, splitting or spalling forces become decisive due to the low tensile capacity of the concrete.

Post-Installed Reinforcement Approvals

There are European Technical Approvals for post-installed rebar connections. Systems getting such approvals have to be assessed according to the EOTA technical guideline TR023 [2] (available in the EOTA website). Requirements for a positive assessment are an installation system providing high installation quality for deep holes and an adhesive fulfilling the test requirements of the guideline TR023. Obtaining the approval is basically the proof that the post-installed rebars work at least as well as cast-in rebars (with respect to bond strength and displacement); consequently, the design of the rebar anchorage is performed according to structural concrete design codes, in the case of Europe this is Eurocode 2 [1].

High Quality Adhesives Required

Assessment criteria

EOTA TR023 [2] specifies a number of tests in order to qualify products for post-installed rebar applications. These are the performance areas checked by the tests:

1. bond strength in different strengths of concrete
2. substandard hole cleaning
3. Wet concrete
4. Sustained load and temperature influence
5. Freeze-thaw conditions
6. Installation directions
7. Maximum embedment depth
8. Avoidance of air bubbles during injection
9. Durability (corrosion, chemical attack)

Approvals with or without exceptions

If an adhesive fulfills all assessment criteria of EOTA TR023, rebar connections carried out with this adhesive can be designed with the bond strength and minimum anchorage length according to Eurocode 2 [1] as outlined in section 2.2 of this document.

Adhesives which do not fully comply with all assessment criteria can still obtain an "approval with exceptions".

- If the bond strength obtained in tests does not fulfil the specified requirements, then bond strengths lower than those given by Eurocode 2 shall be applied. These values are given in the respective ETA.
- If it cannot be shown that the bond strength of rebars post-installed with a selected product and cast-in rebars in cracked concrete ($w=0.3\text{mm}$) is similar, then the minimum anchorage length $\ell_{b,min}$ and the minimum overlap length $\ell_{o,min}$ shall be increased by a factor 1.5.

2 Design of Post-Installed Reinforcement

There are two design methods which are supported by Hilti:

1. Based on the approval (ETA) for the mortar system qualified according to EOTA TR023 [2] which allows to use the accepted structural code Eurocode 2 EN 1992-1-1:2011 [1], chapters 8.4: "anchorage of longitudinal reinforcement" and 8.7 "Laps and mechanical couplers" taking into account some adhesive specific parameters. This method is called

"ETA/EC2 Design Method"

paragraph 2.2 gives an overview of the design approach and design examples, technical data from the rebar approvals can be found in section 6.

2. For applications which are not covered by "ETA/EC2 Design Method", the design approach of Eurocode 2 has been extended on the basis of extensive internal as well as external research [6 - 8] as well as assessments [9]. This method is called

"Hit Rebar Design Method"

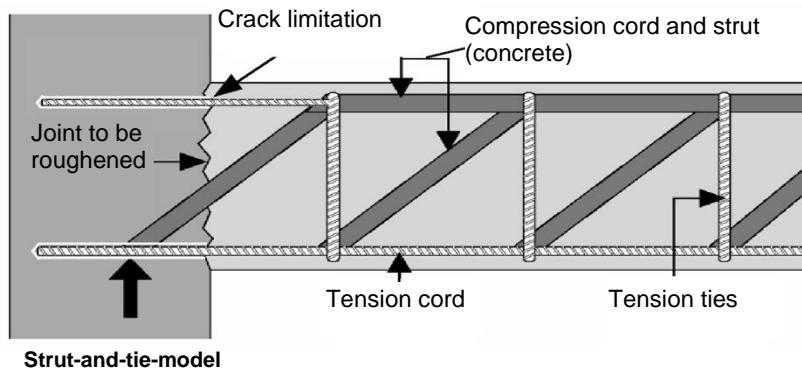

which offers an extended range of applications (please see section 2.3 for an overview of the design approach as well as design examples).

2.1 Loads on Reinforcing Bars

Strut and Tie Model

Strut-and-tie models are used to calculate the load path in reinforced concrete members. Where a non-linear strain distribution exists (e.g. supports) strut-and-tie models may be used {Clause 6.5.1(1), EC2: EN 1992-1-1:2011}.

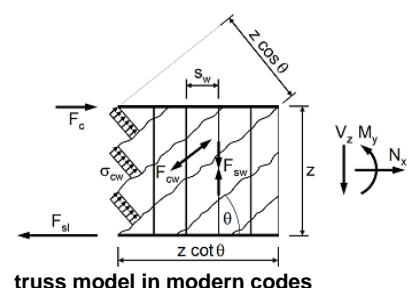

Strut-and-tie models consist of struts representing compressive stress fields, of ties representing the reinforcement and of the connecting nodes. The forces in the elements of a strut-and-tie model should be determined by maintaining the equilibrium with the applied loads in ultimate limit state. The ties of a strut-and-tie model should coincide in position and direction with the corresponding reinforcement {Clause 5.6.4, EC2: EN 1992-1-1:2011 Analysis with strut and tie models}.

In modern concrete design codes the strut angle θ can be selected within certain limits, roughly between 30° and 60° . Many modern concrete design codes show a figure similar to the following:

The equilibrium equations in horizontal direction gives the force in the reinforcement:

$$F_{sl} = \frac{M_y}{z} + \frac{N_x}{2} + \frac{V_z \cdot \cot \theta}{2}$$

2.2 Approval Based ETA/EC2 Design Method

2.2.1 Application Range

The principle that rebars are anchored “where they are not needed any more” (anchorage) or where the force is taken over by another bar (splice) and the fact that only straight rebars can be post-installed lead to the application range shown by the figures taken from EOTA TR023 [2]:

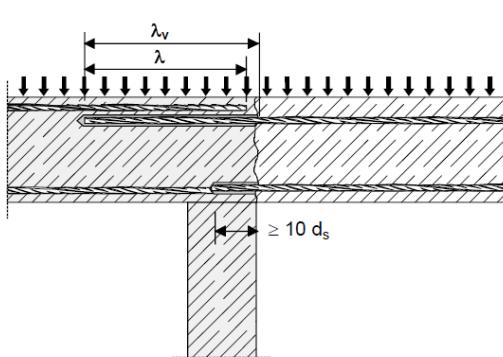

Figure 1.1: Overlap joint for rebar connections of slabs and beams

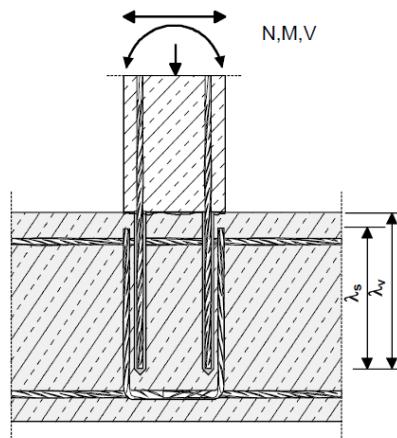

Figure 1.2: Overlap joint at a foundation of a column or wall where the rebars are stressed in tension

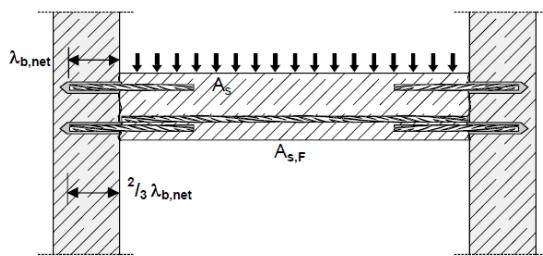

Figure 1.3: End anchoring of slabs or beams, designed as simply supported

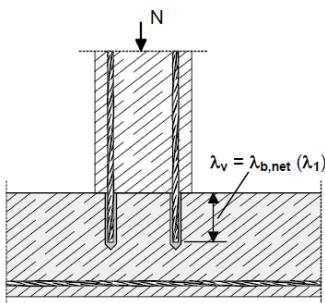

Figure 1.4: Rebar connection for components stressed primarily in compression. The rebars are stressed in compression

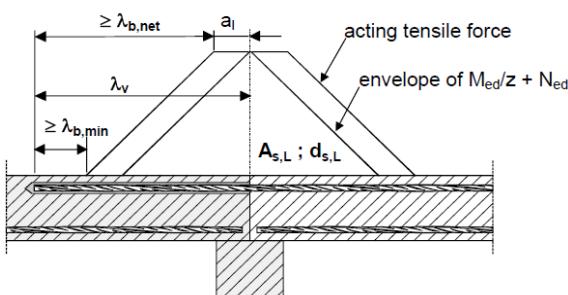

Figure 1.5: Anchoring of reinforcement to cover the line of acting tensile force

Application range according to EOTA TR023

Note to Figure 1.1 to 1.5:

In the Figures no transverse reinforcement is plotted, the transverse reinforcement as required by EC 2 shall be present. The shear transfer between old and new concrete shall be designed according to EC 2.

All other applications lead to tensile stress in the concrete. Therefore, the principle "works like cast-in" would not be true any more. Such cases must be considered with specific models exceeding the approval based approach to post-installed rebar connections.

2.2.2 Design of Development and Overlap Length with Eurocode 2

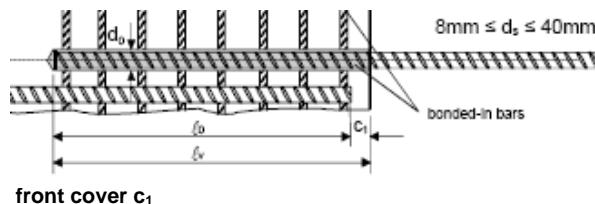

The following reflect the design relevant sections from EOTA TR023, chapter 4 "Assumptions under which the fitness of use is to be assessed" and from the specific European Technical Approvals:

Design method for post-installed rebar connections

- The post-installed rebar connections assessed according to this Technical Report shall be designed as straight cast-in-place rebars according to EC2 using the values of the design bond resistance f_{bd} for deformed bars as given in the relevant approval.
- Overlap joint for rebars: For calculation of the effective embedment depth of overlap joints the concrete cover at end-face of the post-installed rebar c_1 shall be considered:

$$l_v \geq l_0 + c_1$$

with:
 l_0 = required lap length
 c_1 = concrete cover at end-face of bonded-in rebar

- The definition of the bond region in EC2 is valid also for post-installed rebars.
- The conditions in EC2 concerning detailing (e.g. concrete cover in respect to bond and corrosion resistance, bar spacing, transverse reinforcement) shall be complied with.
- The transfer of shear forces between new and old concrete shall be designed according to EC2 [1].

Additional provisions

- To prevent damage of the concrete during drilling the following requirements have to be met:

- Minimum concrete cover:

$$c_{min} = 30 + 0,06 l_v \geq 2d_s \text{ (mm) for hammer drilled holes}$$

$$c_{min} = 50 + 0,08 l_v \geq 2d_s \text{ (mm) for compressed air drilled holes}$$

The factors 0,06 and 0,08 should take into account the possible deviations during the drilling process. This value might be smaller if special drilling aid devices are used.

Furthermore the minimum concrete cover given in clause 4.4.1.2, EC2: EN 1992-1-1: 2004 shall be observed.

- Minimum clear spacing between two post-installed bars $a = 40 \text{ mm} \geq 4d_s$

- To account for potentially different behaviour of post-installed and cast-in-place rebars in cracked concrete,

- in general, the minimum lengths $l_{b,min}$ and $l_{o,min}$ given in the EC 2 for anchorages and overlap splices shall be increased by a factor of 1.5. This increase may be neglected under certain conditions. The relevant approval states under which conditions the factor can be neglected for a specific adhesive.

Preparation of the joints

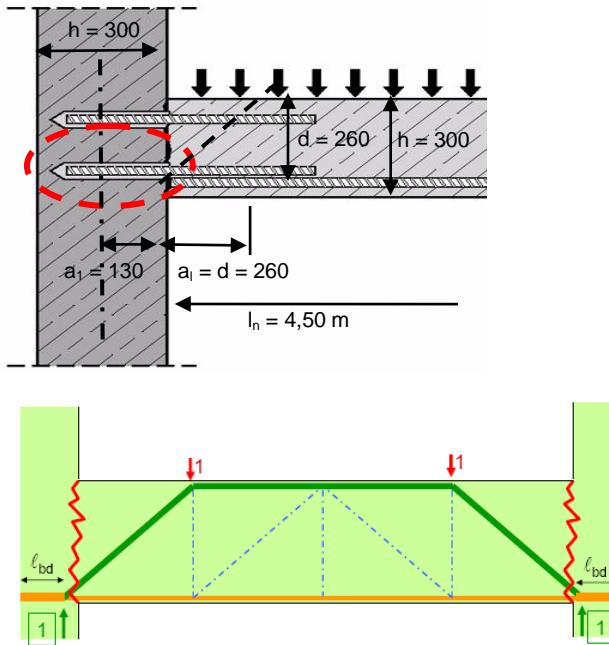

- The surface of the joint between new and existing concrete should be prepared (roughing, keying) according to the envisaged intended use according to EC2.
- In case of a connection being made between new and existing concrete where the surface layer of the existing concrete is carbonated, the layer should be removed in the area of the new reinforcing bar (with a diameter $d_s+60\text{mm}$) prior to the installation of the new bar.

Transverse reinforcement

The requirements of transverse reinforcement in the area of the post-installed rebar connection shall comply with clause 8.7.4, EC2: EN 1992-1-1:2011.

2.2.3 Design Examples

a) End support of slab, simply supported

Bottom reinforcement at support:

$$\text{Tension force to be anchored: } F_E = |V_{Ed}| \cdot a_l / (0.9d) = 100 \text{ kN/m} \quad \{\text{Clause 9.2.1.4(2), EC2: EN 1992-1-1:2004}\}$$

$$\text{Steel area required: } A_{s,rqd} = F_E \cdot \gamma_s / f_{yk} = 231 \text{ mm}^2/\text{m}$$

Minimum reinforcement to be anchored at support:

$$A_{s,min} = K_c \cdot k \cdot f_{ct,eff} \cdot A_s / \sigma_s = 0,4 \cdot 1 \cdot 2,2 \cdot 150 \cdot 1000 / 500 = 264 \text{ mm}^2/\text{m} \quad \{\text{Clause 7.3.2(2), EC2: EN 1992-1-1:2011}\}$$

$$A_{s,min} = 0,50 \cdot 988 = 499 \text{ mm}^2/\text{m} \quad \{\text{Clause 9.3.1.2(1), EC2: EN 1992-1-1:2011}\}$$

$$A_{s,min} = 0,25 \cdot 1010 = 251 \text{ mm}^2/\text{m} \quad \{\text{Clause 9.2.1.4(1), EC2: EN 1992-1-1:2011}\}$$

Decisive is 499 mm²/m \Rightarrow reinforcement provided: Ø12, s = 200 mm $\Rightarrow A_{s,prov} = 565 \text{ mm}^2/\text{m}$
Installation by wet diamond core drilling: Hilti HIT-RE 500 is suitable adhesive (see Tech data, sect. 2.2.3)

Basic anchorage length {EC2: EN 1992-1-1:2004, section 8.4.3}:

$$\ell_{b,rqd} = (d_s / 4) \times (\sigma_{sd} / f_{bd})$$

with: d_s = diameter of the rebar = 12 mm

$$\sigma_{sd} = \text{calculated design stress of the rebar} = (A_{s,rqd} / A_{s,prov}) \cdot (f_{yk} / \gamma_s) = (231 / 565) \cdot (500 / 1,15) = 177 \text{ N/mm}^2$$

$$f_{bd} = \text{design value of bond strength according to corresponding ETA} (= 2,3 \text{ N/mm}^2)$$

$$\ell_{b,rqd} = (12 / 4) \times (177 / 2,3) = 231 \text{ mm}$$

Design anchorage length {EC2: EN 1992-1-1:2011, section 8.4.4}:

$$\ell_{bd} = \alpha_1 \alpha_2 \alpha_3 \alpha_4 \alpha_5 \ell_{b,rqd} \geq \ell_{b,min}$$

with: $\ell_{b,rqd}$ as above

$\alpha_1 = 1,0$ for straight bars

$$\alpha_2 = 1 - 0,15(c_d - \emptyset) / \emptyset \quad (0,7 \leq \alpha_2 \leq 1,0)$$

α_2 is for the effect of concrete cover, in this case half the clear spacing: $c_d = (200 - 12) / 2 = 94 \text{ mm}$

$$\alpha_2 = 0,7$$

$\alpha_3 = 1,0$ because of no transverse reinforcement

$\alpha_4 = 1,0$ because of no welded transverse reinforcement

$\alpha_5 = 1,0$ influence of transverse pressure is neglected in this example

slab: $l_n = 4,50 \text{ m}$, $Q_k = 20 \text{ kN/m}^2$, $h = 300 \text{ mm}$, $d = 260 \text{ mm}$

wall: $h = 300 \text{ mm}$

Concrete strength class: C20/25, dry concrete

Reinforcement: $f_{yk} = 500 \text{ N/mm}^2$, $\gamma_s = 1,15$

$$\text{Loads: } G_k = 25 \text{ kN/m}^3 \cdot h = 7,5 \text{ kN/m}^2; \\ S_d = (1,50 \cdot Q_d + 1,35 \cdot G_k) = 40,1 \text{ kN/m}^2$$

Structural analysis (design forces):

$$M_{Ed} = S_d \cdot l_n^2 / 8 = 102 \text{ kNm/m} \\ V_{Ed} = S_d \cdot l_n / 2 = 90,3 \text{ kN/m}$$

Bottom reinforcement required at mid span:

$$A_{s,rqd,m} = (M_{sd} \cdot \gamma_s) / (0,9 \cdot d \cdot f_{yk}) = 998 \text{ mm}^2/\text{m}$$

$$\text{reinforcement provided at mid span: } \varnothing 16, s = 200 \text{ mm} \\ A_{s,prov,m} = 1005 \text{ mm}^2/\text{m}$$

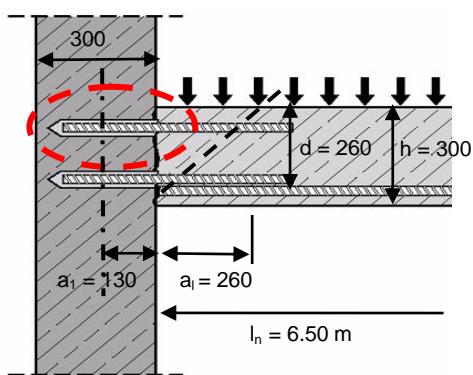

$$\ell_{bd} = 0,7 \cdot 231 = 162 \text{ mm}$$

minimum anchorage length {Clause 8.4.4(1), EC2: EN 1992-1-1:2011}:

$$\ell_{b,min} = \max \{0,3\ell_{b,rqd}; 10\phi; 100\text{mm}\} = 120 \text{ mm}$$

ℓ_{bd} controls → drill hole length **$I_{ef} = 162 \text{ mm}$**

Top reinforcement at support:

Minimum reinforcement:

- a) 25% of bottom steel required at mid-span
{Clause 9.3.1.2(2), EC2: EN 1992-1-1:2004}
 $A_{s,req} = 0,25 \cdot 988 = 247 \text{ mm}^2/\text{m}$
- b) requirement for crack limitation :
{Clause 7.3.2(2), EC2: EN 1992-1-1:2004}
 $A_{s,min} = 0,4 \cdot 1 \cdot 2,2 \cdot 150 \cdot 1000 / 435 = 303 \text{ mm}^2/\text{m}$

Decisive is $303 \text{ mm}^2/\text{m}$

⇒ reinforcement provided: $\phi 10$, $s = 200 \text{ mm}$; $A_{s,prov} = 393 \text{ mm}^2/\text{m}$

Design stress in bar: $\sigma_{sd} = f_{yd} \cdot A_{s,min} / A_{s,prov} = 335 \text{ N/mm}^2$

$$\ell_{b,rqd} = (d_s / 4) \times (\sigma_{sd} / f_{bd}) = (10 / 4) \times (335 / 2.3) = 364 \text{ mm}$$

$$\ell_{bd} = a_1 a_2 a_3 a_4 a_5 \ell_{b,rqd} = 0,7 \cdot 364 = 255 \text{ mm}$$

$$\ell_{b,min} = \max \{0,3\ell_{b,rqd}; 10\phi; 100\text{mm}\} = 120 \text{ mm}$$

Therefore, drill hole length **$I_{ef} = 255 \text{ mm}$**

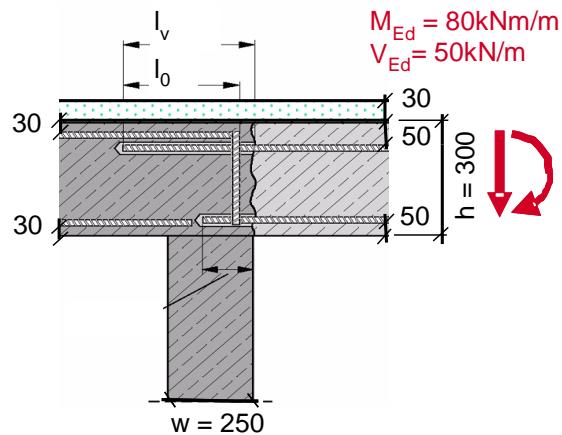

If wet diamond core drilling is used {Clause 8.4.4(1), EC2: EN 1992-1-1:2011}:

$\ell_{b,min} = \max \{0,3\ell_{b,rqd}; 10\phi; 100\text{mm}\} \cdot 1.5 = 180 \text{ mm}$ (as wet diamond core drilling is used, the minimum values according do EC2 have to be multiplied by 1.5, see tech data)

-> in this case the minimum length will control, drill hole length for the lower layer will be **$I_{ef,diamond,lower} = 180 \text{ mm}$** and will remain for the upper layer **$I_{ef,diamond,upper} = 255 \text{ mm}$** .

b) splice on support

General information for design example

- Bending moment: $M_{Ed}=80 \text{ kNm/m}$; shear: $V_{Ed} = 50 \text{ kN/m}$
- slab: cover cast-in bars $c_c = 30 \text{ mm}$ (top, bottom); cover new bars: $c_n = 50 \text{ mm}$ $h = 300 \text{ mm}$;
- top reinforcement (new and existing): $\phi 16$, $s = 200 \text{ mm}$; $A_{s,prov} = 1005 \text{ mm}^2/\text{m}$; cover to face $c_1 = 30 \text{ mm}$
- bottom reinforcement: $\phi 10$, $s=200 \text{ mm}$; $A_{s,prov}=393 \text{ mm}^2/\text{m}$
- Concrete strength class: C25/30
- Properties of reinforcement: $f_{yk} = 500 \text{ N/mm}^2$
- Fire resistance: R60 (1 hour),
Light weight plaster for fire protection: $t_p=30 \text{ mm}$;
maximum steel stress in fire $\sigma_{Rd,fi} = 322 \text{ N/mm}^2$
- Hilti HIT-RE 500

Cast-in reinforcement top

$$l_{0,ci} = \alpha_1 \alpha_2 \alpha_3 \alpha_5 \alpha_6 l_{b,rqd,ci} \geq l_{0,min}$$

$\eta_1 = (d - \phi/2 > 250\text{mm})$	0.7	poor bond condition
$Z_{ci} =$	239 mm	(from static calculation)
$A_{s,req} = (M_{Ed}/z) \cdot (\gamma_s/f_{yk}) = (80/0.239) \cdot (1.15/0.5) =$	770 mm ² /m	
$\sigma_{sd} = (A_{s,rqd} / A_{s,prov}) \cdot (f_{yk}/\gamma_s) = (770 / 1005) \cdot (500 / 1.15) =$	333 N/mm ²	
$f_{bd} = 2.25 \cdot \eta_1 \cdot 0.7 \cdot 0.3 \cdot f_{ck}^{2/3} / \gamma_c = 2.25 \cdot 0.7 \cdot 0.7 \cdot 0.3 \cdot 25^{2/3} / 1.5 =$	1.89 N/mm ²	(ETA 08/0105)

$$l_{b,rqd,pi} = (\phi / 4) \cdot (\sigma_{sd} / f_{bd}) = (16 / 4) \cdot (333 / 1.89) = 705 \text{ mm}$$

$\alpha_1 =$	0.7	hooked end of cast-in bars
$\alpha_2 = (1 - 0.15(c_d - \phi)/\phi \geq 0.7) = 1 - 0.15(30 - 16)/16 =$	0.87	
$\alpha_3 =$	1.0	no transverse reinforcement
$\alpha_5 =$	1.0	no transverse pressure
$\alpha_6 =$	1.5	splice factor

$$l_{0,min} = \max\{0.3 \cdot 1.5 \cdot 705; 15 \cdot 16; 200\} = 317 \text{ mm}$$

$$l_{0,ci} = 0.70 \cdot 0.87 \cdot 1.5 \cdot 705 = 643 \text{ mm}$$

Post-installed reinforcement top

The required design lap length l_0 shall be determined in accordance with EC2: EN 1992-1-1:2004, section 8.7.3:

$$l_{0,pi} = \alpha_1 \alpha_2 \alpha_3 \alpha_5 \alpha_6 l_{b,rqd,pi} \geq l_{0,min}$$

$d = h - c_n - \phi/2 = 300 - 50 - 16/2 =$	242 mm	
$\eta_1 = (d - \phi/2 < 250\text{mm})$	1.0	good bond condition
$Z =$	228 mm	(from static calculation)
$A_{s,req} = (M_{Ed}/z) \cdot (\gamma_s/f_{yk}) = (80/0.228) \cdot (1.15/0.5) =$	807 mm ² /m	
$\sigma_{sd} = (A_{s,rqd} / A_{s,prov}) \cdot (f_{yk}/\gamma_s) = (807 / 1005) \cdot (500 / 1.15) =$	349 N/mm ²	
$f_{bd} = \text{design value of bond strength according to 2.2.3} =$	2.7 N/mm ²	(ETA 08/0105)

$$l_{b,rqd,pi} = (\phi / 4) \cdot (\sigma_{sd} / f_{bd}) = (16 / 4) \cdot (349 / 2.7) = 516 \text{ mm}$$

$\alpha_1 =$	1.0	for straight bars
--------------	-----	-------------------

$\alpha_2 = (1 - 0.15(c_d - \phi)/\phi \geq 0.7) = 1 - 0.15(50 - 16)/16 =$	0.7	
$\alpha_3 =$	1.0	no transverse reinforcement
$\alpha_5 =$	1.0	no transverse pressure

Embedment depth for post-installed rebars top:

$e = [(s/2)^2 + (c_n - c_c)^2]^{0.5} - \phi = [100^2 + (50 - 30)^2]^{0.5} - 16 =$	86 mm	clear spacing between spliced bars
$\Delta l_0 = e - 4\phi = 86 - 4 \cdot 16 =$	22 mm	
$l_0 = \max(l_{0,pi}; l_{0,pi,fi}; l_{0,ci}; l_{0,min}) + \Delta l_0 = 711 + 22 =$	733 mm	
$c_f =$	30 mm	
$w/2 =$	125 mm	
$l_v = l_0 + \max(w/2; c_f) = 758 + 125 =$	858 mm	

Embedment depth for post-installed rebars bottom:

Concrete in compression, no force on bars → anchorage with minimum embedment length.

$f_{min} =$	1.0 mm	
$l_{b,min} = f_{min} \cdot \max(10\phi; 100\text{mm}) = 1.0 \cdot \max(10 \cdot 10; 100) =$	100 mm	(ETA 08/0105)
$w/2 =$	125 mm	
$l_v = l_{b,min} + w/2 = 100 + 125 =$	225 mm	

2.3 HIT-Rebar Design Method

While the EC2/ETA design method is of direct and simple use, it has two main drawbacks

- The connection of simply supported slabs to walls is only possible if the wall is thick enough to accommodate the anchorage length. As reductions of the anchorage length with hooks or welded transverse reinforcement cannot be made with post-installed reinforcement, it often occurs that the wall is too small. However, if the confinement of the concrete is large enough, it is actually possible to use the full

bond strength of the adhesive rather than the bond strength given by Eurocode 2 [1]. The so-called "splitting design" allows to design for the full strength of the adhesive [5, 9].

- According to traditional reinforced concrete principles, moment resisting frame node connections required bent connection bars. In this logic, they can therefore not be made with straight post-installed rebar connections. The frame node model is a proposed strut and tie model to design moment resisting frame node connections with straight connection bars [6, 7].

2.3.1 Splitting Design

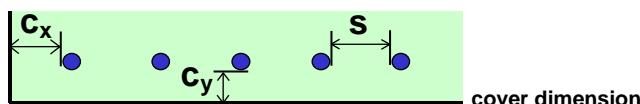

The factor α_2 of Eurocode 2 [1] gives an explicit consideration for splitting and spalling as a function of concrete cover and bar spacing. European Technical Approvals recommend the same procedure for post-installed rebar connections:

$$l_{bd,spl} = \frac{\phi}{4} \cdot \frac{\sigma_{sd}}{f_{bd}} \cdot \alpha_2$$

f_{bd} according to technical data (ETA's for post-installed anchors) (1)

$$\alpha_2 = 1 - 0.15 \cdot \frac{c_d - \phi}{\phi}$$

$$c_d = \min(c_x; c_y; s/2)$$

This function is adapted and extended for post-installed reinforcement for the HIT-Rebar design concept: Eurocode 2 limits the α_2 value to $\alpha_2 \geq 0.7$. This can be interpreted as follows: as long as α_2 exceeds 0.7, spalling of the concrete cover or splitting between bars will be the controlling mode of failure. If α_2 is less than 0.7, corresponding to cover dimensions of $c_d/\phi > 3$, the cover is large enough so that splitting cannot occur any more and pullout will control. Assuming an infinitely strong adhesive, there would be no such lower limit on α_2 and the bond stress, at which splitting occurs can be expressed as:

$$f_{bd,spl} = \frac{f_{bd}}{1 - 0.15 \cdot \frac{c_d - \phi}{\phi}}$$

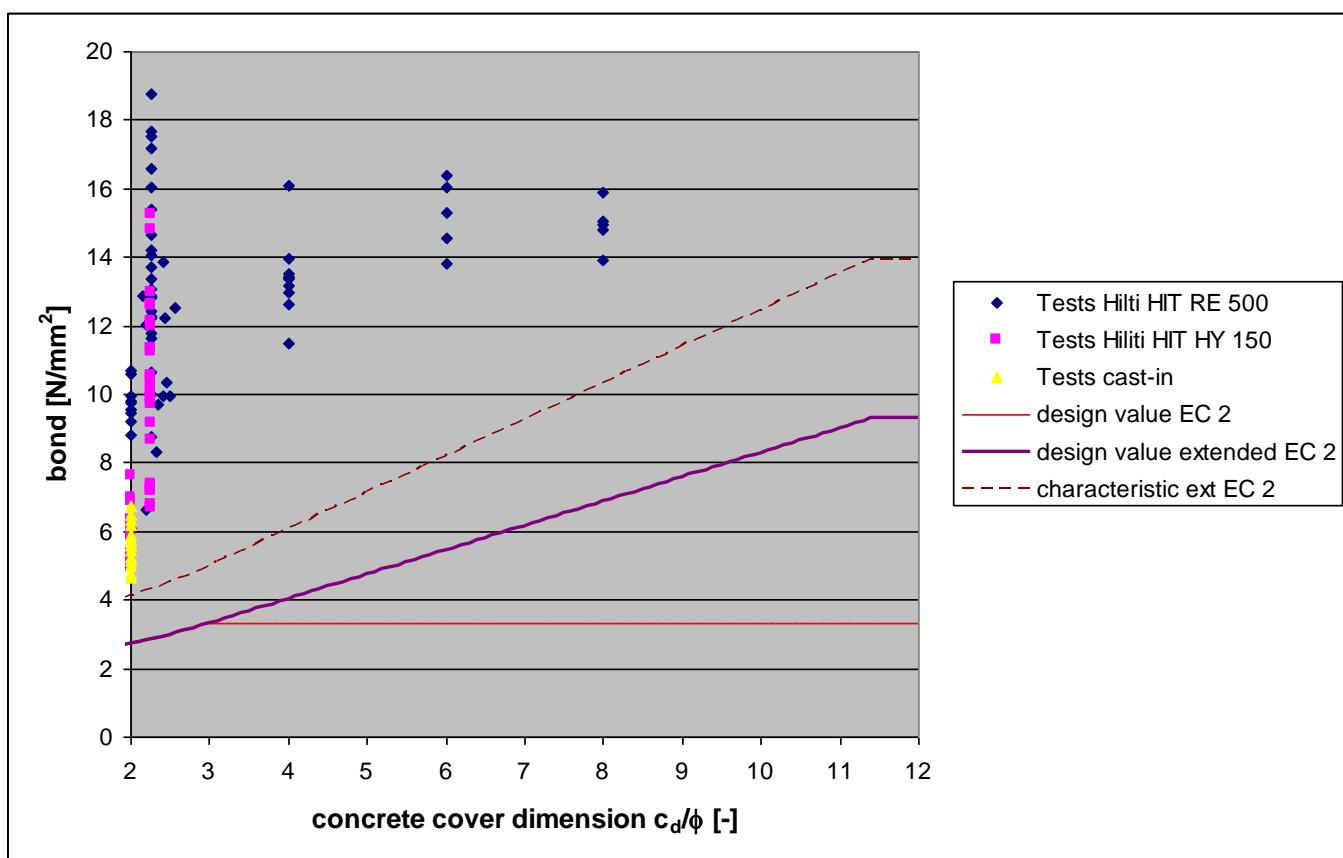

For cover dimensions exceeding the range of Eurocode 2, i.e. for $c_d/\phi > 3$ (bonded-in bars only), an adapted factor α_2' is used to create a linear extension of the bond strength function:

$$\alpha_2' = \frac{1}{\frac{1}{0.7} + \delta \cdot \frac{c_d - 3 \cdot \phi}{\phi}}$$

$$f_{bd,spl2} = \frac{f_{bd}}{\max[\alpha_2'; 0.25]}$$

where δ is a factor defining the growth of the linear function for $f_{bd,spl2}$; it is calibrated on the basis of tests. In order to avoid unreasonably low values of α_2' , its value is limited to $\alpha_2' \geq 0.25$.

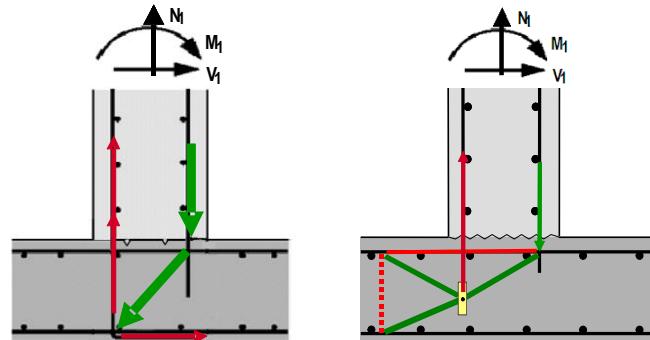

Below is a typical design bond stress f_{bd} curve as a function of the minimum edge distance/spacing distance, c_d is shown for a concrete class C20/25 and for a rebar with a diameter of not more than 32mm. In this figure the equivalent design bond stresses according to EC 2 and resulting from the above described definition of α_2 and α_2' are plotted. The design bond strength is defined by an inclined line and it increases with larger values of c_d . The diagram also shows the characteristic value of the bond strength ($f_{bd} \cdot \gamma_c$ where $\gamma_c=1.5$).

The increase in the design bond stress is limited by the maximum pull-out bond stress, which is a value given by the standards in the case of a cast-in reinforcement. For post-installed reinforcement, the maximum design bond stress is a function of the bonding agent and not necessarily equals that of cast-in bars; it will be taken from the relevant anchor approval. Thus, the limitation for bond failure in the code has been replaced by the specific design bond stress of the bonding agent for the specific application conditions and the splitting function has been adapted according to the tests.

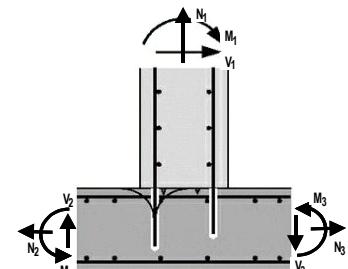

2.3.2 Strut and Tie Model for Frame Nodes

If frame nodes (or moment resisting connections in general) are designed with cast-in reinforcement, they usually require bent bars according to the standard reinforced concrete design rules. Anchoring the reinforcement of moment resisting connections with straight bars would, at least at first sight, result in concrete that is under tension, and therefore in a possible concrete cone failure. As this failure mode is brittle, such an anchorage is not allowed by the standard concrete design rules. In cooperation with the Technical University of Munich, Hilti performed a research programme in order to provide a strut-and-tie model for frame nodes with straight connection bars [6, 7]. The main differences to the standard cast-in solution are that the compression strut is anchored in the bonding area of the straight bar rather than in the bend of the bar and that, therefore, first the inner lever arm inside the node is reduced and second, splitting forces in the transition zone between D- and B-region must be considered.

Global Equilibrium of the Node

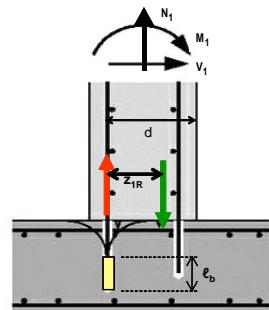

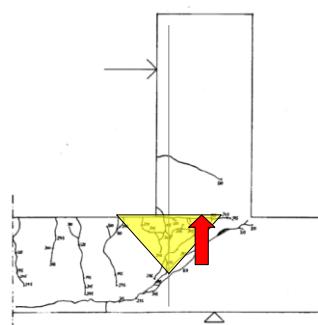

In order to check the struts and ties inside the node, the reactions N_2 , V_2 , M_2 , N_3 , V_3 , M_3 at the other ends of the node need to be defined. Normally, they result from the structural analysis outside the node region and will be determined by the designer in charge.

Global equilibrium of the node

Tension in connecting bars

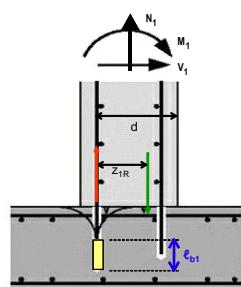

The loading of the wall in the figures results in a tensile force in the reinforcement on the left hand side and in a compression force on the right hand side. Initial tests and computer simulations led to the consideration that the straight bar has a tendency to push a concrete cone against the interface with the wall. Thus the compressive stress is in the interface is not concentrated on the outside of the wall, but distributed over a large part of the interface, which leads to a reduced lever arm in the wall section. The recommended reduction factor is 0.85 for opening moments and 1.0 for closing moments.

Anchorage length

While the equilibrium inside of frame nodes with cast-in hooked bars can be modeled with the compression strut continuing from the vertical compression force and anchored in the bend at the level of the lower reinforcement, straight bars are anchored by bond stresses at a level above the lower reinforcement.

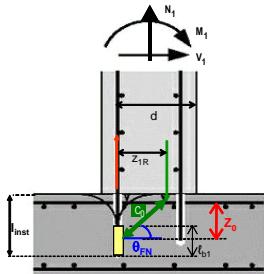

As bending cracks are expected to occur along the bar from the top of the base concrete, the anchorage zone is developing from the lower end of the bar and its length ℓ_b is that required to develop the steel stress calculated from the section forces M_1 , N_1 and V_1 .

$$\ell_b = \frac{\sigma_{sd} \cdot \phi}{4 \cdot f_{bd}}$$

with σ_{sd} design steel stress in the connection bars [MPa]
 ϕ diameter of the vertical bar [mm]
 f_{bd} design bond strength of cast-in bar to concrete or of the adhesive mortar [MPa]

Installation length

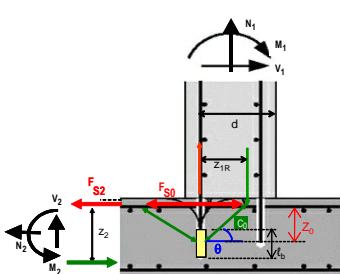

The strut-and-tie model requires that the angle θ between the inclined compression strut C_0 and the horizontal direction is 30° to 60° . For low drill hole lengths the resulting strut angle will be less than 30° . In such situations the design will not work as tests have shown. Also in order to remain as close as possible to the original solution with the bent bar, it is recommended to drill the holes as deep as possible in order to achieve a large strut angle θ_{FN} .

Note that PROFIS Rebar will preferably propose the installation length such that the strut angle θ_{FN} is 60° . In cases where the existing section is too thin for this, it will propose the maximum possible embedment depth which is defined for bonded anchors in ETAG 001, part 5, section 2.2.2 as

$$l_{inst,max} = h_{member} - \max(2 \cdot d_0; 30\text{mm})$$

with $l_{inst,max}$ maximum possible installation length [mm]
 h_{member} thickness of the existing concrete member [mm]
 d_0 diameter of the drilled hole [mm]

Tension in Existing Reinforcement

For a drilled hole depth l_{inst} and a concrete cover of the upper reinforcement to the center of the bars of c_s , the lever arm inside z_0 the node is:

$$z_0 = l_{inst} - \frac{\ell_b}{2} - c_s$$

The lever arm inside the node z_0 is smaller than the lever arm of the slab z_2 . The tension in the upper slab reinforcement in the node region, F_{s0} , is higher than the tension calculated for the slab with z_2 ; the tensile resistance of the existing upper reinforcement $A_{s0,prov}$ must therefore be checked separately as follows:

$$F_{s2} = M_2/z_2 + N_2/2 \quad (\text{tension in existing reinforcement outside node area})$$

$$H_{s2} = \left(M_1 + (V_2 + V_3) \cdot \frac{z_1}{2} \right) \cdot \left(\frac{1}{z_0} - \frac{1}{z_2} \right) + V_1 \cdot \left(\frac{z_1}{z_0} - 1 \right) \quad (\text{additional tension in node due to reduced lever arm})$$

$$F_{s0} = F_{s2} + H_{s2} \quad (\text{steel tension in node area})$$

$$A_{s0,rqd} = F_{s0}/(f_{yk}/\gamma_s) \quad (\text{steel area required in existing part for forces from new part})$$

If $A_{s0,prov} \geq A_{s0,rqd}$ the reinforcement of the existing part is sufficient, provided that the forces from the new part are the only load on the section. This is the analysis obtainable from PROFIS Rebar.

As mentioned further above, a more sophisticated check needs to be made if there are also other loads in the system. Basically it would mean replacing F_{s2} as evaluated by under "global equilibrium" above by that evaluated in the complete static design.

The shallower the embedment of the post-installed vertical bar is, the more the moment resistance of the slab in the node region is reduced compared to a node with hooked bar. For this reason, it is also recommended to provide deep embedment of the connecting bars rather than trying to optimize mortar consumption by trying to recommend the shortest possible embedment depth.

Concrete Compressive Strut

The strut-and-tie model assumes that the compression strut C_0 is anchored at the center of the anchorage zone and that its thickness corresponds to the length of the anchorage zone ℓ_b .

$$F_{c0} = \frac{M_1 + (V_2 + V_3) \cdot z_1 / 2}{z_0} \quad (\text{horizontal component of concrete strut force})$$

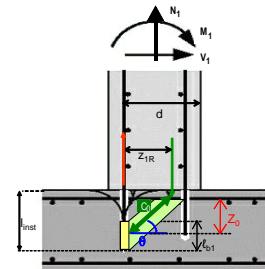

$$D_0 = F_{c0} / \cos \theta_{FN}$$

$$\sigma_{Rd,max} = v' \cdot k_2 \cdot \alpha_{cc} \cdot f_{ck} / \gamma_c$$

(reduced concrete strength in tension-compression node according to ENV1992-1-1, 4.5.4(4b). Standard parameters: $v'=1-f_{ck}/250$; $k_2=0.85$; $\alpha_{cc}=1.0$; $\gamma_c=1.5$, subject to variations in National Application Documents)

$$D_{0,R} = \sigma_{Rd,max} \cdot \ell_b \cdot w \cdot \cos \theta_{FN}$$

(resistance of concrete in strut direction, w =width of section)

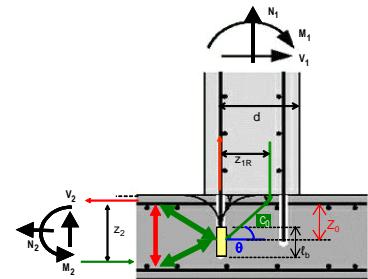

If $D_{0,R} \geq D_0$ the concrete strut can take up the loads introduced from the new section.

Splitting of Concrete in Transition Area

On the left hand side of the anchorage zone, the compression force is continuing through additional struts to the tension and compression zones of the B-region of the slab where the equilibrium of the horizontal forces is given. The vertical components of these struts are taken up by tensile stresses in the concrete. Normally there is no vertical reinforcement in the slab to take up the tension force. The loads and thermal solicitations of a slab do not lead to horizontal cracking; therefore it is possible to attribute the tension force to the tensile capacity of the concrete. On the safe side, the maximum splitting stress has been taken as that caused by a concentrated load C_0 on the center of the anchorage zone. It has been shown that the occurring splitting stress $\max\sigma_{sp}$ can be calculated as

$$\max\sigma_{sp} = \left(M_1 + \frac{(V_2 + V_3) \cdot z_1}{2} \right) \cdot \left(1 - \frac{z_0}{z_2} \right) \cdot \left(1 - \frac{\ell_b}{2 \cdot z_2} \right) \cdot \left(\frac{2.42}{b \cdot z_2^2} \right) \leq f_{ct}$$

with: M_1, V_2, V_3 :

external forces on node according to figure 5

z_2 inner lever arm of slab section outside node region

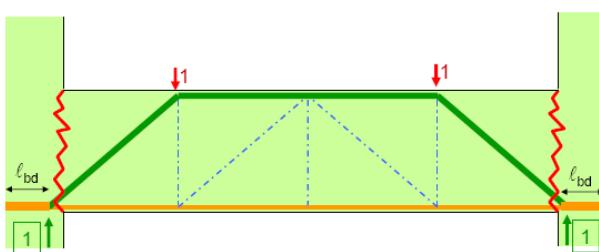

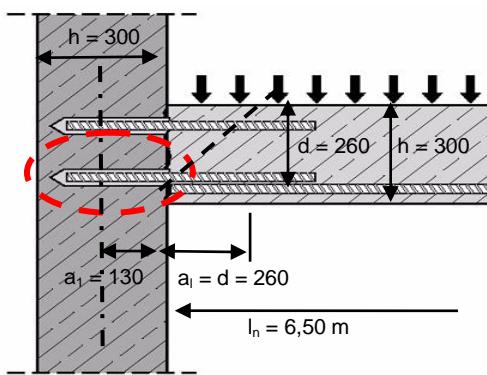

b width of the wall section

$f_{ctd} = \alpha_{ct} \cdot 0.7 \cdot 0.3 \cdot f_{ck}^{2/3} / \gamma_c$ tensile strength of concrete (Standard value in EC2: $\alpha_{ct}=1.0$, subject to variations in National Application Documents)

If the calculated maximum splitting stress is smaller than the tensile strength of the concrete f_{ct} , then the base plate can take up the splitting forces without any additional shear reinforcement.

2.3.3 Design Examples

a) End support of slab, simply supported

Bottom reinforcement at support:

$$\begin{aligned} \text{Tension force to be anchored: } F_{Ed} &= |V_{Ed}| \cdot a_l / (0.9d) &= 100 \text{ kN/m} & \text{(Clause 9.2.1.4(2), EC2: EN 1992-1-1:2004)} \\ \text{Steel area required: } A_{s,rqd} &= F_{Ed} \cdot \gamma_s / f_{yk} &= 231 \text{ mm}^2/\text{m} \end{aligned}$$

Minimum reinforcement to be anchored at support:

$$\begin{aligned} A_{s,min} &= k_c \cdot k \cdot f_{ct,eff} \cdot A_s / \sigma_s = 0,4 \cdot 1 \cdot 2,2 \cdot 150 \cdot 1000 / 500 &= 264 \text{ mm}^2/\text{m} & \text{(Clause 7.3.2(2), EC2: EN 1992-1-1:2011)} \\ A_{s,min} &= 0,5 \cdot A_{s,rqd,m} = 0,50 \cdot 988 &= 499 \text{ mm}^2/\text{m} & \text{(Clause 9.3.1.2(1), EC2: EN 1992-1-1:2011)} \\ A_{s,min} &= 0,25 \cdot A_{s,prov,m} = 0,25 \cdot 1010 &= 251 \text{ mm}^2/\text{m} & \text{(Clause 9.2.1.4(1), EC2: EN 1992-1-1:2011)} \end{aligned}$$

Decisive is 499 mm²/m \Rightarrow reinforcement provided: Ø12, s = 200 mm $\Rightarrow A_{s,prov} = 565 \text{ mm}^2/\text{m};$

Installation by hammer drilling; Hilti HIT-RE 500

Minimum anchorage length

$$\begin{aligned} \sigma_{sd} &= (A_{s,rqd} / A_{s,prov}) \cdot (f_{yk}/\gamma_s) = (23 / 565) \cdot (500 / 1,15) &= 177 \text{ N/mm}^2 \\ f_{bd,EC2} & &= 2,3 \text{ N/mm}^2 & \text{(EC 2 for minimum length. see tech. data, sect. 6)} \\ \ell_{b,rqd} &= (\phi / 4) \times (\sigma_{sd} / f_{bd}) = (12 / 4) \times (177 / 2,3) &= 231 \text{ mm} \\ \ell_{b,min} &= \max \{0,3 \ell_{b,rqd}; 10\phi; 100 \text{ mm}\} &= 120 \text{ mm} & \text{(Clause 8.4.4(1), EC2: EN 1992-1-1:2011)} \end{aligned}$$

Development length:

$$\begin{aligned} \text{Cover dimension: } c_d &= (s - \phi) / 2 = &= 94 \text{ mm} \\ \text{Confinement } c_d / \phi &= 94 / 12 &= 7,8 \end{aligned}$$

$$\alpha_2' = \frac{1}{\frac{1}{0.7} + \delta \cdot \frac{c_d - 3\phi}{\phi}} = \frac{1}{\frac{1}{0.7} + 0.306 \cdot \frac{94 - 3 \cdot 12}{12}} = 0.344$$

Splitting bond strength for $c_d/\phi > 3$:

$$f_{bd,spl,2} = \frac{f_{bd,EC2}}{\max(\alpha_2'; 0.25)} = \frac{2.3}{0.344} = 6.7 \text{ N/mm}^2$$

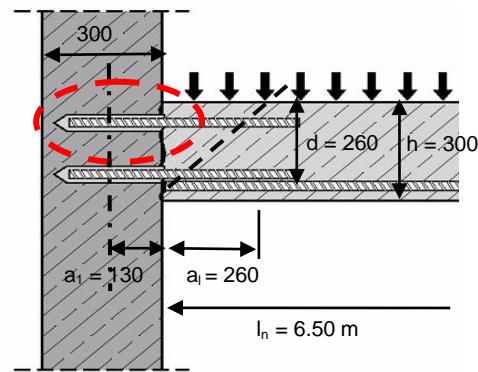

Pullout bond strength: $f_{bd,p}$ = 8.6 N/mm² (see tech. data, sect. 6)

Applicable design bond strength: $f_{bd} = \min(f_{bd,spl}; f_{bd,p})$ = 6.7 N/mm²

Design development length: $\ell_{bd} = (\phi/4) \cdot (\sigma_{sd}/f_{bd})$ = 80 mm

Minimum length controls → drill hole length l_{ef} = 120 mm

Top reinforcement at support:

Minimum reinforcement:

- a) 25% of bottom steel required at mid-span
{Clause 9.3.1.2(2), EC2: EN 1992-1-1:2004}

$$A_{s,req} = 0.25 \cdot 988 = 247 \text{ mm}^2/\text{m}$$

- b) requirement for crack limitation :

{Clause 7.3.2(2), EC2: EN 1992-1-1:2004}

$$A_{s,min} = 0.4 \cdot 1 \cdot 2,2 \cdot 150 \cdot 1000 / 435 = 303 \text{ mm}^2/\text{m}$$

Decisive is 303 mm²/m

⇒ reinforcement provided: Ø10, s = 200 mm; $A_{s,prov} = 393 \text{ mm}^2/\text{m}$

Design stress in bar: $\sigma_{sd} = f_{yd} \cdot A_{s,min} / A_{s,prov} = 335 \text{ N/mm}^2$

Minimum anchorage length

$$\sigma_{sd} = (A_{s,rqd} / A_{s,prov}) \cdot (f_{yk}/\gamma_s) = (23 / 565) \cdot (500/1,15) = 335 \text{ N/mm}^2$$

$$f_{bd,EC2} = 2,3 \text{ N/mm}^2 \quad (\text{EC 2 for minimum length. see tech. data, sect. 6})$$

$$\ell_{b,rqd} = (\phi / 4) \times (\sigma_{sd} / f_{bd}) = (10 / 4) \times (335 / 2.3) = 364 \text{ mm}$$

$$\ell_{b,min} = \max \{0.3\ell_{b,rqd}; 10\phi; 100\text{mm}\} = 110 \text{ mm} \quad (\text{Clause 8.4.4(1), EC2: EN 1992-1-1:2011})$$

Development length:

Cover dimension: $c_d = (s - \phi)/2 = 95 \text{ mm}$

Confinement $c_d/\phi = 95/10 = 9.5$

$$\alpha_2' = \frac{1}{\frac{1}{0.7} + \delta \cdot \frac{c_d - 3\phi}{\phi}} = \frac{1}{\frac{1}{0.7} + 0.306 \cdot \frac{95 - 3 \cdot 10}{10}} = 0.293$$

Splitting bond strength for $c_d/\phi > 3$:

$$f_{bd,spl,2} = \frac{f_{bd,EC2}}{\max(\alpha_2'; 0.25)} = \frac{2.3}{0.293} = 7.9 \text{ N/mm}^2$$

Pullout bond strength: $f_{bd,p}$ = 8.6 N/mm² (see tech. data, sect. 6)

Applicable design bond strength: $f_{bd} = \min(f_{bd,spl}; f_{bd,p})$ = 7.9 N/mm²

Design development length: $\ell_{bd} = (\phi/4) \cdot (\sigma_{sd}/f_{bd})$ = 97 mm

Minimum length controls → drill hole length $l_{ef} = 110 \text{ mm}$

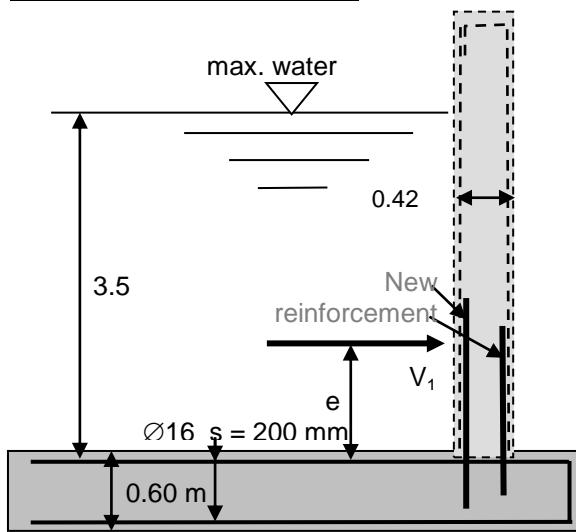

Therefore, drill hole length $l_{ef} = 110\text{mm}$

If wet diamond core drilling is used:

$l_{b,min} = \max \{0,3l_{b,rqd}; 10\phi; 100\text{mm}\} \cdot 1.5 = 180 \text{ mm}$ (as wet diamond core drilling is used, the minimum values according do EC2 have to be multiplied by 1.5, see tech data)

-> in this case the minimum length will control, drill hole length $l_{ef} = 180\text{mm}$ for upper and lower layers

b) Wall bending connection

Note: transverse reinforcement not

Geometry:

$$\begin{aligned} h_1 &= 420 \text{ mm}; h_2 = h_3 = 600 \text{ mm}; \\ d_1 &= 380 \text{ mm}; d_2 = d_3 = 560 \text{ mm}; \\ z_1 &= 360 \text{ mm}; z_2 = z_3 = 520 \text{ mm} \\ A_{s0} &= A_{s2} = A_{s3} = 1005 \text{ mm}^2/\text{m} (\varnothing 16 \text{ s} = 200 \text{ mm}) \\ c_s &= h_2 - d_2 = 40 \text{ mm} \end{aligned}$$

Material:

$$\begin{aligned} \text{Concrete: C20/25 (new and existing parts), } \gamma_s &= 1.5 \\ \text{Steel grade: } 500 \text{ N/mm}^2, \gamma_s &= 1.15 \end{aligned}$$

$$\text{Safety factor for variable load: } \gamma_Q = 1.5$$

HIT-RE 500-SD (temperature range I)

Acting loads:

$$\begin{aligned} V_{1d} &= \gamma_Q \cdot p \cdot h^2 / 2 = 1.4 \cdot 10 \cdot 3.5^2 / 2 & = 92 \text{ kN/m} \\ e &= h / 3 = 3.5 / 3 & = 1.17 \text{ m} \\ M_{1d} &= V_{1d} \cdot e = 92 \cdot 1.17 & = 107 \text{ kNm/m} \end{aligned}$$

Force in post-installed reinforcement

$$\begin{aligned} z_{1r} &= 0.85 \cdot z_1 = 0.85 \cdot 360 & = 306 \text{ mm} & \text{(opening moment } \rightarrow \text{reduced inner lever arm)} \\ F_{s1d} &= M_{1d} / z_{1r} = 107 / 0.306 & = 350 \text{ kN/m} \\ A_{s1,rqd} &= F_{s1d} / (f_{yk}/\gamma_{Ms}) = 350'000 / (500 / 1.15) & = 805 \text{ mm}^2/\text{m} \\ \text{Select } \varnothing 12 \text{ mm, spacing } s_1 &= 125 \text{ mm } \rightarrow A_{s1,prov} & = 905 \text{ mm}^2 \\ \rightarrow \text{drilled hole diameter: } d_0 & & = 16 \text{ mm} \\ \text{Stress in bar: } \sigma_{sd} &= F_{s1d} / A_{s1,prov} & = 386 \text{ N/mm}^2 \end{aligned}$$

Anchorage length

$$\begin{aligned} f_{bd,EC2} & & = 2.3 \text{ N/mm}^2 & \text{(EC 2 for minimum length)} \\ \ell_{b,rqd,EC2} &= (\varnothing/4) \cdot (\sigma_{sd}/f_{bd,EC2}) & = 504 \text{ mm} \\ \ell_{b,min} &= \max \{0,3\ell_{b,rqd,EC2}; 10\varnothing; 100 \text{ mm}\} & = 151 \text{ mm} \end{aligned}$$

$$\begin{aligned} f_{bd,b} & & = 8.3 \text{ N/mm}^2 & \text{(see tech. data, sect. 6)} \\ c_d &= s_1/2 - \varnothing/2 & = 56.5 \text{ mm} > 3\varnothing \\ \alpha'_2 &= \frac{1}{\max \left[\frac{1}{0.7} + \delta \cdot \frac{c_d - 3\varnothing}{\varnothing}; 0.25 \right]} & = 0.512 \\ f_{bd,spl2} &= \frac{f_{bd}}{\max [\alpha'_2; 0.25]} & = 4.5 \text{ N/mm}^2 \\ f_{bd} &= \min \{f_{bd,b}; f_{bd,spl}\} & = 4.5 \text{ N/mm}^2 \\ \ell_{b1} &= \max \{(\varnothing/4) \cdot (\sigma_{sd} / f_{bd}); \ell_{b,min}\} & = 258 \text{ mm} \end{aligned}$$

Drilled hole length

$$\ell_{\text{inst,max}} = h_2 - \max\{2d_0; 30\text{mm}\} = 568 \text{ mm} \quad (\text{maximum possible hole length})$$

$$\ell_{\text{inst},60} = c_s + z_{1R} \cdot \tan 60^\circ + \ell_{b1} / 2 = 672 \text{ mm} \quad (\text{hole length corresponding to } \theta=60^\circ)$$

$$\ell_{\text{inst},60} > \ell_{\text{inst,max}} \rightarrow \text{select hole length } \ell_{\text{inst}} = \ell_{\text{inst,max}} = 568 \text{ mm}$$

$$\text{Strut angle with } \ell_{\text{inst,max}}: \tan \theta = (\ell_{\text{inst,max}} - c_s - \ell_{b1}/2) / z_{1R} \rightarrow \theta_{FN} = 53^\circ$$

check: $\theta > 30^\circ \rightarrow \text{ok}$

Reaction in Foundation:

$$-M_{2d} = M_{1d} + V_{1d} \cdot z_2 / 2 = 107 + 0.25 \cdot 92 = 131 \text{ kNm/m}$$

$$N_{2d} = -V_{1d} = -92 \text{ kN/m}$$

$$M_{s3} = 0; V_{2d} = V_{3d} = 0; N_1 = N_3 = 0$$

Check of foundation reinforcement

$$F_{s2d} = M_{2d} / z_2 + N_{2d} / 2 = 298 \text{ kNm/m} \quad (\text{tension outside node area})$$

$$z_0 = \ell_{\text{inst}} - c_s - \ell_{b1} / 2 = 568 - 40 - 258/2 = 399 \text{ mm} \quad (\text{lever arm in node area})$$

$$H_{s2d} = M_{1d} \cdot (1/z_0 - 1/z_2) + V_{1d} \cdot (z_1/z_0 - 1) = 53 \text{ kNm/m} \quad (\text{additional force in node area})$$

$$F_{s2d,\text{node}} = F_{s2d} + H_{s2d} = 351 \text{ kNm/m} \quad (\text{tension in node area})$$

$$A_{s2,\text{reqd}} = F_{s2d,\text{node}} / (f_{yk}/\gamma_{Ms}) = 351'000 / (500 / 1.15) = 808 \text{ mm}^2/\text{m}$$

$$A_{s2} > A_{s2,\text{reqd}} \rightarrow \text{ok} \quad (A_{s2} \text{ is given})$$

Check concrete compressive strut

$$F_{c0d} = M_{1d} / z_0 = 268 \text{ kN/m}$$

$$D_{0d} = F_{c0d} / \cos \theta_{FN} = 441 \text{ kN/m}$$

$$\alpha_{ct} = 1.0 \quad (\text{EC2: EN 1992-1-1:2004, 3.1.6(1)})$$

$$v' = 1-f_{ck}/250 = 0.92 \quad (\text{EC2: EN 1992-1-1:2004, 6.5.2(2)})$$

$$k_2 = 0.85 \quad (\text{EC2: EN 1992-1-1:2004, 6.5.4(4b)})$$

$$D_{0Rd} = \alpha_{ct} \cdot v' \cdot k_2 \cdot f_{ck} / \gamma_c \cdot \ell_{b1} \cdot \cos \theta_{FN} = 1639 \text{ kN/m}$$

$$D_{0Rd} > D_{0d} \rightarrow \text{ok}$$

Check concrete splitting in plane of foundation

$$\alpha_{ct} = 1.0 \quad (\text{EC2: EN 1992-1-1:2004, 3.1.6(2)})$$

$$f_{ctk,0.05} = \alpha_{ct} \cdot 0.7 \cdot 0.3 \cdot f_{ck}^{2/3} / \gamma_c = 1.03 \text{ N/mm}^2 \quad (\text{table 3.1, EC2: EN 1992-1-1:2004})$$

$$M_{sp,d} = F_{c0d} \cdot z_0 \cdot (1 - z_0/z_2) \cdot (1 - \ell_{b1}/(2z_2)) = 1.87 \cdot 10^7 \text{ Nmm/m}$$

$$W_{sp} = 1000 \text{ mm} \cdot z_2^2 / 2.41 = 1.12 \cdot 10^8 \text{ mm}^3/\text{m}$$

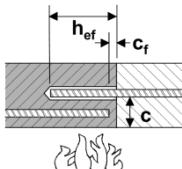

$$\text{max}\sigma_{sp} = M_{sp,d} / W_{sp} = 0.17 \text{ N/mm}^2$$

$$f_{ctk,0.05} > \text{max}\sigma_{sp} \rightarrow \text{ok}$$

2.4 Load Case Fire

The bond strength in slabs under fire has been evaluated in tests and is certified by reports of the Technical University of Brunswick, Germany. The conformity with the German standards is confirmed in DIBt German national approvals, the one with British Standard BS8110:1997 in the Warrington Fire Report. French cictm Approvals also give data for beams. These documents are downloadable from the Intranet for the different adhesive mortars.

There are two types of design tables corresponding to the basic fire situations "parallel" and "anchorage".

In the fire situation "**parallel**" the only parameter is the clear distance from the fire exposed concrete surface to the perimeter of the bar ("clear concrete cover c "). From this parameter, one can directly read the bond strength of the adhesive for specific fire durations.

In fire design, it influences like is sufficient to anchorage load under fire

$\tau_{Rd,fi}$

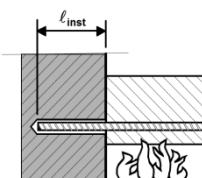

Clear concrete cover c [mm]	Max. bond stress, τ_c [N/mm]			
	F30	F60	F90	F120
10	0	0	0	0
20	0,494	0	0	0
30	0,665	0,481	0	0
40	0,897	0,623	0	0
50	1,200	0,623	0	0
60	1,630	0,806	0,513	0
70	2,197	1,043	0,655	0,487
80	2,962	1,351	0,835	0,614
90	3,992	1,748	1,065	0,775
100	5,382	2,263	1,358	0,977
110	7,255	2,930	1,733	1,233
120	9,780	3,792	2,210	1,556
130		4,909	2,818	1,963
140		6,355	3,594	2,477
150		8,226	4,584	3,125

Fire design

$$F_{fire} = f_{bd,fi} \cdot \phi \cdot \pi \cdot h_{ef}$$

is not necessary to re-calculate bond condition or alpha factors. It prove that the calculated splice or length is sufficient to transmit the with the given fire bond strength

table for situation „parallel“

In the fire situation "**anchorage**" the tables directly show the fire resistance as a force [kN] for given diameters, embedment depths and fire durations.

The tables mention a maximum steel force in fire. It is important to know that this value is derived for a specific assumed value of $f_{yk,fi}$ (see sect. 2.1.2) and will be different for other values of $f_{yk,fi}$. In the published tables

$f_{yk,fi}=322\text{N/mm}^2$ was normally assumed; if this value was given as e.g. $f'_{yk,fi}=200\text{N/mm}^2$ the maximum force for bar diameter 8mm in the table below would be Max. $F'_{s,T}=10.1\text{kN}$. This would then imply that in the columns on the right side, all values would be cut off at 10.1kN, i.e. the values 16.2 or 13.01 would not appear any more.) That means that there is no such thing as a given maximum force in fire.

Intermediate values between those given in the fire design tables may be interpolated linearly. Extrapolating is not permitted.

Bar Ø [mm]	Drill hole Ø [mm]	Max. $F_{s,T}$ [kN]	ℓ_{inst} [mm]	F30 [kN]	F60 [kN]	F90 [kN]
8	12	16,2	80	2,18	0,73	0,24
			120	8,21	2,90	1,44
			170	16,2	9,95	5,99
			210		16,2	13,01
			230			16,2
			250			
			300			
10	14	25,3	100	5,87	1,95	0,84

$$R_{fire} = \phi \cdot \pi \cdot \sum_{i=1}^n \tau_{crit,i} \cdot \ell_i$$

Fire design table for situation „anchorage“

2.5 Fatigue of bonded-in reinforcement for joints

General notes

For load bearing elements which are subjected to considerable cyclic stress the bonded-in connections should be designed for fatigue. In that case evidence for fatigue of reinforcing steel bars, concrete and bond should be provided separately.

For simple cases it is reasonable to use simplified methods on the safe side.

The partial safety factors for loads are specified in the code for reinforced concrete.

The partial safety factors for material are specified in Table 4.3.

Table 4.3: Partial safety factors for materials subjected to cyclic loading

Evidence for	concrete	bond	reinforcing bars (steel)
Partial safety factor	1.5	1.8	1.15

Fatigue of reinforcing bars (steel)

The resistance for fatigue of reinforcing bars (steel) is specified in the actual code for reinforced concrete. The behaviour of the steel of reinforcing bars bonded-in by means of HIT-Rebar is at least as good as cast-in place reinforcement.

Fatigue of bond and concrete (simplified approach)

As a simple and conservative approach on the safe side evidence for fatigue is proven if the following equation is valid:

$$F_{Sd,fat} \leq N_{Rd} \cdot f_{fat}$$

where:

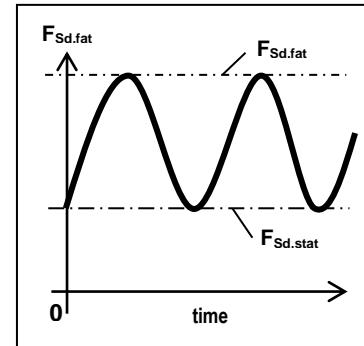

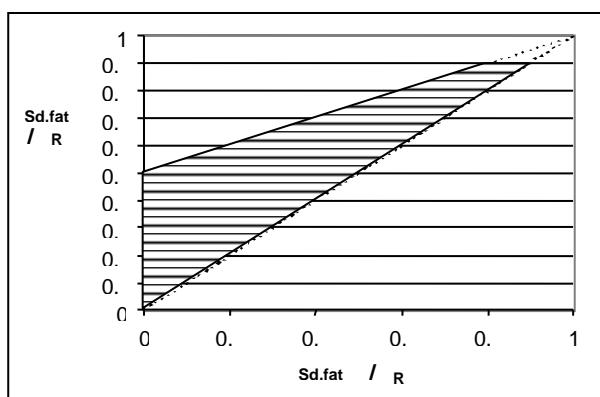

$F_{Sd,fat}$ Design value of the anchorage force for the ruling loading model for fatigue.

N_{Rd} Design resistance for static load of the anchorage (bond and concrete).

f_{fat} Reduction factor for fatigue for bond and concrete: $f_{fat} = 0.5$

If max/min of cycles is known, reduction factors are shown in Figure 4.13.

Diagram for a simplified approach
with $2 \cdot 10^6$ cycles (Weyrauch diagram)

Reduction factors for fatigue for bond and concrete

If the simplified method is not satisfying, additional information using the "Woehler" - lines is available.

Ask Hilti Technical Service for the Hilti Guideline: TWU-TPF 06a/02 HIT-Rebar: Fatigue.

Design Approach

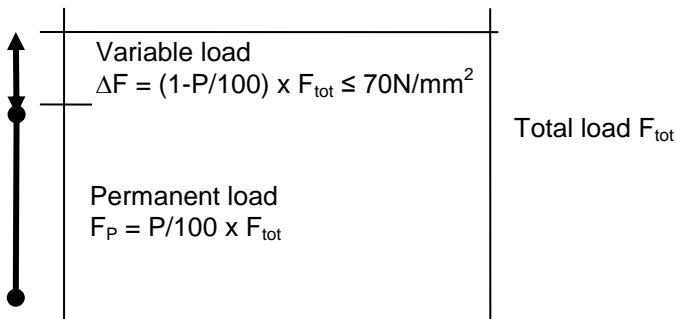

Steel resistance:

The steel resistance under fatigue load is calculated from the part of the load which is permanent, the allowable stress variation and the steel yield strength. The safety factors are the same as those used for static design (taken from ENV 1992-2-2:1996, sect. 4.3.7.2).

$\Delta\sigma_{s,\max}$ = ... maximum allowable stress variation, usually given by codes, e.g. ENV 1992-2-2:1996,

sect. 4.3.7.5: $\Delta\sigma_{s,\max} = 70 \text{ N/mm}^2$

P percentage of the load which is permanent: $0 \leq P \leq 100$

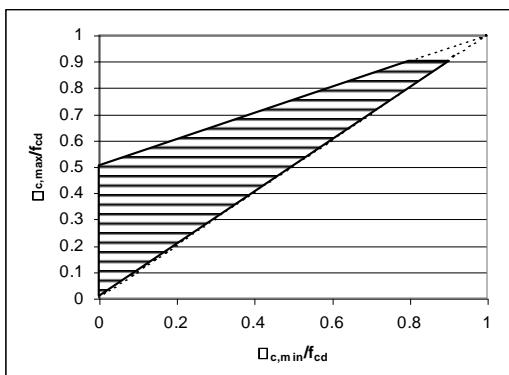

The reduction factor on steel resistance due to dynamic loading is then:

$$f_{\text{red},s,\text{dyn}} = \frac{\min(f_{yk}; \frac{70}{1-P/100})}{f_{yk}}$$

And the steel strength taken into account for fatigue loading is

$$\sigma_{s,\max,\text{dyn}} = f_{\text{red},s,\text{dyn}} \cdot f_{yk}$$

Concrete Resistance

The concrete resistance calculated for static loading is reduced by a reduction factor for fatigue loads, $f_{\text{red},c,\text{dyn}}$, which is applied to all types of concrete failure, i.e. splitting, shear in uncracked and shear in cracked concrete. This factor is calculated from the Weyrauch diagram of Eurocode 2 (ENV 1992-2-2:1996, section 4.3.7.4):

$$f_{\text{red},c,\text{dyn}} = 0.5 + 0.45 \cdot \frac{P}{100} \leq 0.9$$

For $P=100$ (only permanent loads), $f_{\text{red},c,\text{dyn}}$ is, of course 1.0, but as soon as $P<100$, $f_{\text{red},c,\text{dyn}} \leq 0.9$.

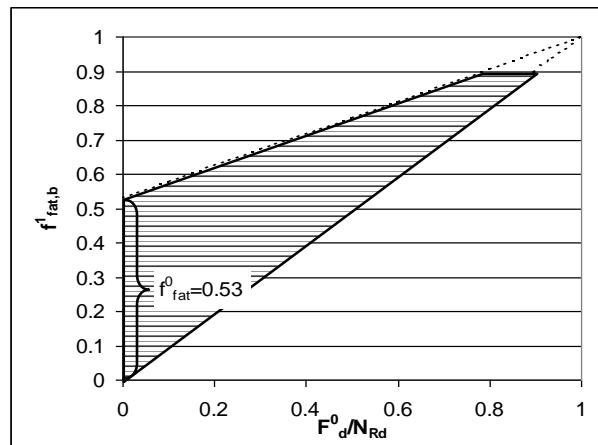

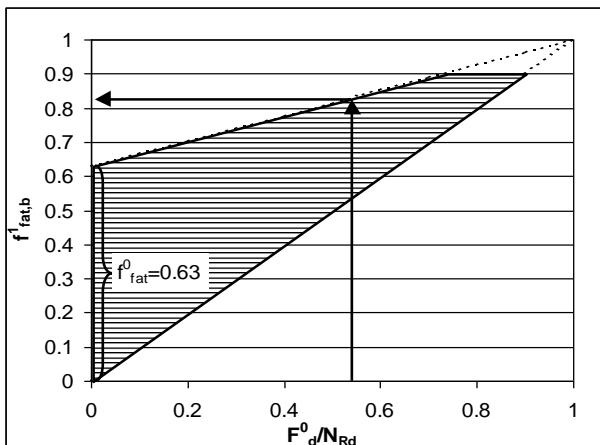

Bond Resistance

The bond resistance calculated for static loading is reduced by a reduction factor for fatigue loads, $f_{\text{red},b,\text{dyn}}$. This factor is calculated from the Weyrauch diagram based on in-house testing and literature reviews [8]. It has to be chosen between two formulas depending on the situation.

a) in general: $f_{\text{red},b,\text{dyn}} = 0.63 + 0.37 \cdot \frac{P}{100} \leq 0.9$

b) HIT-RE 500 in diamond drilled, water saturated hole: $f_{\text{red},b,\text{dyn}} = 0.53 + 0.47 \cdot \frac{P}{100} \leq 0.9$

For P=100 (only permanent loads), $f_{red,c,dyn}$ is, of course 1.0, but as soon as P<100, $f_{red,c,dyn} \leq 0.9$.

2.6 Seismic design of structural post-installed rebar

An increasing population density, the concentration of valuable assets in urban centers and society's dependence on a functioning infrastructure demand a better understanding of the risks posed by earthquakes. In several areas around the globe, these risks have been reduced through appropriate building codes and state of the art construction practices. The development of pre-qualification methods to evaluate building products for seismic conditions additionally contributes to safer buildings for generations to come.

Approval DTA 3/10-649 [10] delivered by CSTB, a member of EOTA, recognizes Hilti HIT-RE 500-SD injectable mortar as a product qualified for structural rebar applications in seismic zones. This national approval requires that qualified products have an ETA approval for rebar, an ETA approval for anchorage in cracked concrete, as well as an ICC-ES pre-qualification for seismic conditions.

The design procedure is fully details in the approval and, in addition to detailing rules of EC2/rebar ETA, consider the following detailing rules of EN1998-1:2004 (Eurocode 8) [11]:

- max $f_{yk} = 500\text{N/mm}^2$
- restricted concrete strengths range: C20/25 to C45/55
- only ductile reinforcement (class C)
- no combination of post-installed and e.g. bent connection bars to ensure displacement compatibility
- columns under tension in critical (dissipation) zones: increase l_{bd} and l_0 , respectively, by 50%
- specific bond strength $f_{bd,seism}$ presented in the following table

By applying engineering judgment, engineers can use this French application document when designing seismic structural post-installed rebar connections. This mentioned practice is presently the only available and fully operational code based procedure in Europe and can as such be considered state-of-the-art.

2.7 Corrosion behaviour

The Swiss Association for Protection against Corrosion (SGK) was given the assignment of evaluating the corrosion behaviour of fastenings post-installed in concrete using the Hilti HIT-HY 200 and Hilti HIT-RE 500 injection systems.

Corrosion tests were carried out. The behaviour of the two systems had to be evaluated in relation to their use in field practice and compared with the behaviour of cast-in reinforcement. The SGK can look back on extensive experience in this field, especially on expertise in the field of repair and maintenance work.

The result can be summarized as follows:

Hilti HIT-HY 200

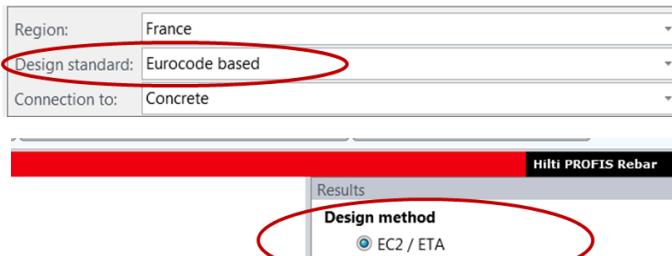

- The Hilti HIT-HY 200 systems in combination with reinforcing bars can be considered resistant to corrosion when they are used in sound, alkaline concrete. The alkalinity of the adhesive mortar safeguards the initial passivation of the steel. Owing to the porosity of the adhesive mortar, an exchange takes place with the alkaline pore solution of the concrete.
- If rebars are bonded-in into chloride-free concrete using this system, in the event of later chloride exposure, the rates of corrosion are about half those of rebars that are cast-in.
- In concrete containing chlorides, the corrosion behaviour of the system corresponds to that of cast-in rebars. Consequently, the use of unprotected steel in concrete exposed to chlorides in the past or possibly in the future is not recommended because corrosion must be expected after only short exposure times.

Hilti HIT-RE 500 + Hilti HIT-RE 500-SD

- If the Hilti HIT-RE 500 system is used in corrosive surroundings, a sufficiently thick coat of adhesive significantly increases the time before corrosion starts to attack the bonded-in steel.
- The HIT-RE 500 system may be described as resistant to corrosion, even in concrete that is carbonated and contains chlorides, if a coat thickness of at least 1 mm can be ensured. In this case, the unprotected steel in the concrete joint and in the new concrete is critical.
- If the coat thickness is not ensured, the HIT-RE 500 system may be used only in sound concrete. A rebar may then also be in contact with the wall of the drilled hole. At these points, the steel behaves as though it has a thin coating of epoxy resin.
- In none of the cases investigated did previously rusted steel (without chlorides) show signs of an attack by corrosion, even in concrete containing chlorides.
- Neither during this study an acceleration of corrosion was found at defective points in the adhesive nor was there any reference to this in literature. Even if a macro-element forms, the high resistance to it spreading inhibits a locally increased rate of corrosion.
- Information in reference data corresponds with the results of this study.

3 Design Programme PROFIS Rebar

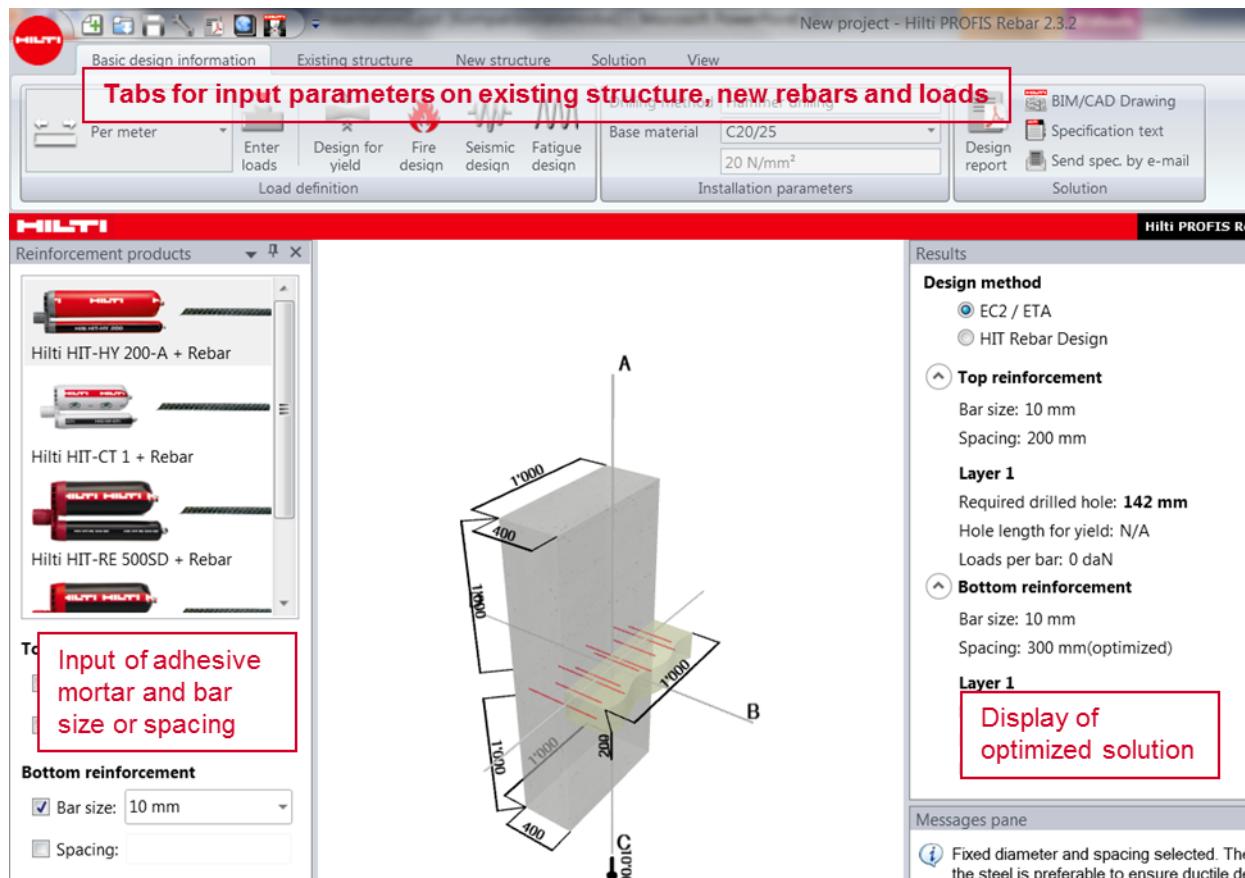

The PROFIS Rebar™ design programme allows rapid and safe design of post-installed reinforcement connections.

When a new project is opened, the user selects between the design methods "Eurocode based" and "ACI based" design methods. After this, the necessary data concerning existing structure, new rebars and loads have to be defined.

The results pane to the right of the drawing lets the user switch between the methods "EC2 / ETA" (see section 2.2) and "HIT rebar design" (see section 2.3).

In the left hand ribbon of the screen, the user can then select the adhesive mortar to be used and either the bar size or the spacing for top and bottom layers. Based on the input data, the program calculates the section forces in steel and concrete as well as the position of the neutral axis. (Elastic-plastic behaviour of the steel is assumed, strain hardening is not taken into account.)

In the right hand ribbon the optimized solution, i.e. the one which uses the least possible cross section of connecting steel is indicated immediately.

Under the "calculation" tab, the user can get all possible solutions and select the appropriate one from a table.

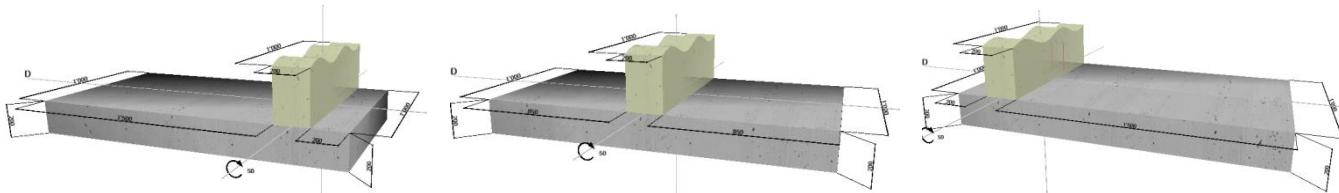

Under the "solution tab" it is possible to print a design report, to download installation instructions or approvals, to access the Hilti online technical library or to send a specification by e-mail

The applications are shown in the following table. For each case the table shows if there is a solution and if yes, which cast-in reinforcement must be defined in order to obtain a solution:

	New and existing members parallel	New and existing members perpendicular
Load	design method: EC2 / ETA Hit Rebar	design method: EC2 / ETA Hit Rebar
compression and/or shear	With high compression requiring compressive reinforcement, existing reinforcement to be spliced is needed	definition of cast-in reinforcement not required
bending moment, shear and/or compression	Overlap splice: Parallel cast-in reinforcement to be defined	No solution, concrete in tension → PROFIS Anchor
tension with or without bending moment and/or shear	Overlap splice: Parallel cast-in reinforcement to be defined	No solution, concrete in tension → PROFIS Anchor

Assumptions made by PROFIS Rebar in frame node design

Note that PROFIS Rebar is making simplified assumptions: it considers only the reactions to N_1 , V_1 , M_1 and it attributes them to the side of the base slab which is defined longer. If both sides of the base slab have the same length, the reaction is distributed to both sides equally:

$$M_2 = -M_1 + V_1 \cdot \frac{z_2}{2} + N_1 \cdot \frac{z_1}{2}$$

$$M_3 = 0$$

$$V_2 = N_1; \quad V_3 = 0$$

$$N_2 = V_1; \quad N_3 = 0$$

$$M_2 = 0$$

$$M_3 = -M_1 + V_1 \cdot \frac{z_2}{2} + N_1 \cdot \frac{z_1}{2}$$

$$V_2 = 0; \quad V_3 = N_1$$

$$N_2 = 0; \quad N_3 = V_1$$

$$M_2 = 0.5 \cdot \left(-M_1 + V_1 \cdot \frac{z_2}{2} + N_1 \cdot \frac{z_1}{2} \right)$$

$$M_3 = 0.5 \cdot \left(-M_1 + V_1 \cdot \frac{z_2}{2} + N_1 \cdot \frac{z_1}{2} \right)$$

$$V_2 = V_3 = N_1 / 2;$$

$$N_2 = N_3 = V_1 / 2$$

Global equilibrium of the node as assumed in PROFIS Rebar

It is important to realize that the checks made by PROFIS Rebar are ONLY for the efforts introduced by the loading of the new concrete part. If the existing part is already loaded by other efforts, the total loading needs to be considered separately by the designer.

In analogy to the global equilibrium of the node, PROFIS Rebar makes the distinction between opening and closing moment on the basis of the length of the existing perpendicular parts on each side of the new part. The case where both perpendicular members have the same length is considered as opening moment since this yields results on the safe side.

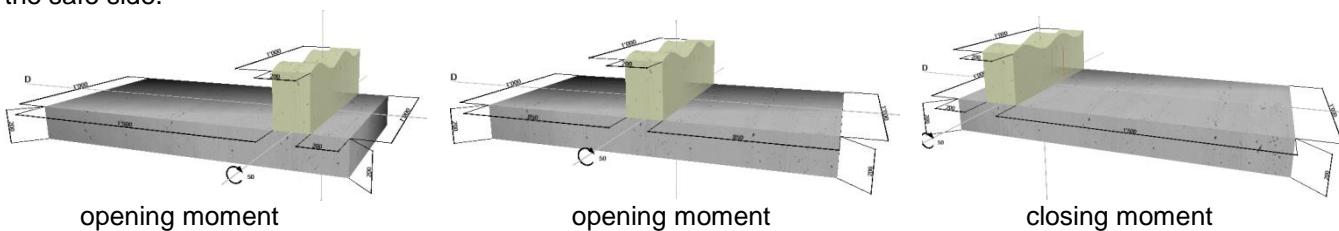

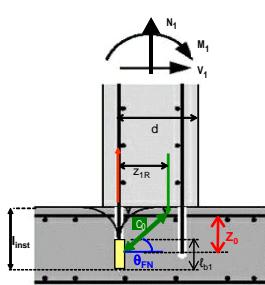

Figure 6: opening and closing moments assumed in PROFIS Rebar

Embedment depth:

- PROFIS Rebar will check the maximum possible setting depth according to ETAG 001, part 5: $h_{ef,max} = h_{member} - \max(2d_0, 30\text{mm})$
- If $h_{ef,max}$ results in a strut angle $\theta_{FN} > 60^\circ$, the drill hole length will be selected such that $\theta_{FN} = 60^\circ$
- If $h_{ef,max}$ results in a strut angle $30^\circ \leq \theta_{FN} \leq 60^\circ$, the drill hole length will be $h_{ef,max}$
- If $h_{ef,max}$ results in a strut angle $\theta_{FN} < 30^\circ$, the strut angle is too small and the model provides no solution.

5 Installation of Post-Installed Reinforcement

5.1 Joint to be roughened

The model of inclined compressive struts is used to transfer the shear forces through the construction joint at the interface between concrete cast at different times. Therefore a rough interface is required to provide sufficient cohesion in the construction joint {Clause 6.2.5(2), EC2: EN 1992-1-1:2004}. Rough means a surface with at least 3 mm roughness ($R_t > 3 \text{ mm}$), achieved by raking, exposing the aggregate or other methods giving an equivalent behaviour.

5.2 Drilling

5.2.1 Standard Drilling

Injection anchor systems are used to fix reinforcement bars into concrete. Fast cure products are generally used with rebar diameters up to 25mm and moderate hole depths of up to about 1.5m, depending on the ambient temperature. Slow cure systems can be used with larger bar diameters and deep holes: The deepest rebar fixing to our knowledge so far was 12m. As rebar embedment lengths are usually much longer than with standard anchor applications, there are a number of additional system components helping to provide high quality of installation:

Drilling aid: Rebars are usually situated close to the concrete surface. If a long drill hole is not parallel to the surface, the inner lever arm of the structure will decrease along the hole if the deviation is away from the surface and even worse, the hole may penetrate the concrete surface or result in insufficient cover if the deviation is towards the surface. According to the rebar approvals, the deviations to be taken into account are 0.08 times the hole length (4.6°) for compressed air drilling, 0.06 times the hole length (3.4°) with hammer drilling and 0.02 times the hole length (1.1°) if a drilling aid is used (optical help or drilling rig, see fig. 11).

Figure 2.9: drilling aids

Depending on the required minimum concrete cover in every section of the post-installed rebar, the minimum "edge distance" at the start of the drilled hole is then:

$$c_{\min} = 50 + 0,08 l_v \geq 2\phi \text{ [mm]} \text{ for compressed air drilled holes}$$

$$c_{\min} = 30 + 0,06 l_v \geq 2\phi \text{ [mm]} \text{ for hammer drilled holes}$$

$$c_{\min} = 30 + 0,02 l_v \geq 2\phi \text{ [mm]} \text{ if a drilling aid is used}$$

5.3 Hole cleaning

The holes should be blown out using compressed, oil free air. Extension tubes and air nozzles directing the air to the hole walls should be used, if holes are deeper than 250mm.

Deeper holes than 250mm should as well be brushed by machine brushing using steel brushes and brush extensions:

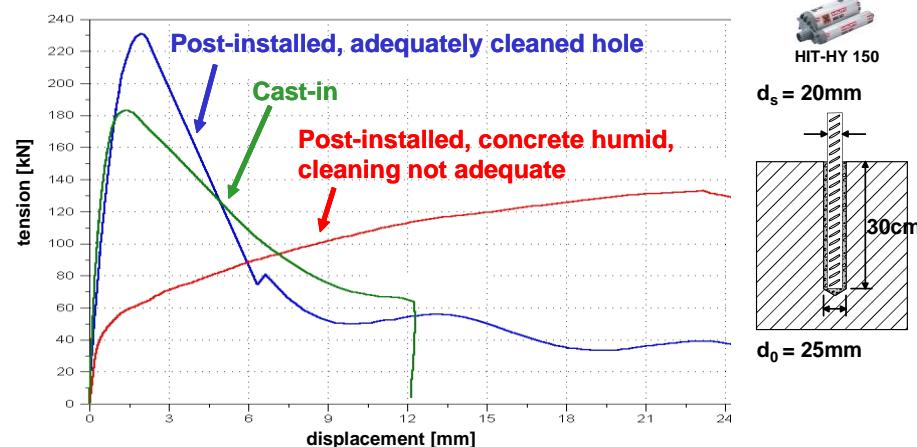

Round steel brush Extension
HIT-RB HIT-RBS 10/0.7 Holder
 TE-Y

Screw the round steel brush HIT-RB to the end of the brush extension(s) HIT-RBS, so that the overall length of the brush is sufficient to reach the base of the borehole. Attach the other end of the extension to the TE-C/TE-Y chuck.

The rebar approvals (ETA) give detailed information on the cleaning procedure for each product.

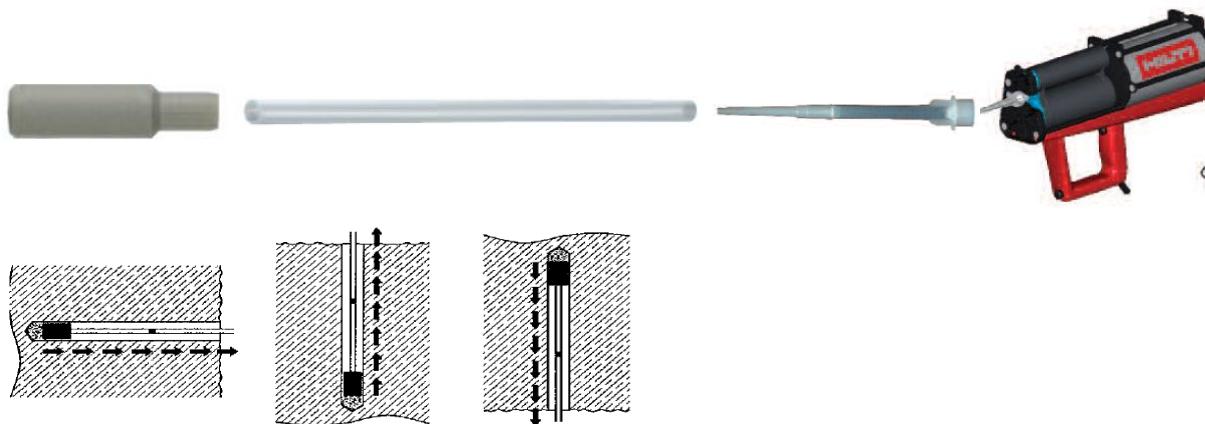

The following figure underlines the importance of adequate hole cleaning: For drilled holes cleaned according to the instruction, the post-installed bar (blue line) shows higher stiffness and higher resistance than the equivalent cast-in bar. With substandard cleaning (red line), however, stiffness and resistance are clearly below those of the cast-in bar.

5.4 Injection and bar installation

It is important that air bubbles are avoided during the injection of the adhesive: when the bar is installed later, the air will be compressed and may eject part of the adhesive from the hole when the pressure exceeds the resistance of the liquid adhesive, thus endangering the installer. Moreover, the presence of air may prevent proper curing of the adhesive.

In order to reach the bottom of the drilled holes, mixer extensions shall be used. The holes should be filled with HIT to about 2/3. Marking the extension tubes at 1/3 of the hole length from the tip will help to dispense the correct amount of adhesive. Piston plugs ensure filling of the holes without air bubbles.

After injecting the HIT, the rebars should be inserted into the hole with a slight rotating movement. When rebars are installed overhead, dripping cups OHC can be used to prevent excess HIT from falling downward in an uncontrolled manner.

5.5 Installation instruction

For correct installation and the linked products, please refer to the detailed "Hilti HIT Installation guide for fastenings in concrete", Hilti Corp., Schaan W3362 1007 as well as to the product specific rebar approvals.

5.6 Mortar consumption estimation for post-installed rebars

Hilti supplies a perfectly matched, quick and easy system for making reliable post-installed rebar connections. When embedment depth and rebar diameter are known, just calculate the number of Hilti HIT cartridges needed.

In the following table please find the quantity of mortar required for one fastening point, in ml. In this estimation, we consider 80% of the mortar is used for fastening, the rest being used for the first pull outs and waste.

The greyed area should not be used since it is not in accordance with the design codes requiring a depth of at least 10 drilling diameters.

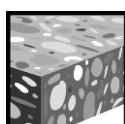

Mortar consumption estimation for post-installed rebars (in ml)

Service temperature range

Temperature range: -40°C to +80°C (max. long term temperature +50°C, max. short term temperature +80°C).

Approvals / certificates

Description	Authority / Laboratory	No. / date of issue
European technical approval	DIBt, Berlin	ETA-09/0295 / 2013-05-09
Application document	CSTB, Marne la Vallée	DTA-3/10-649 / 2010-06-17
European technical approval	DIBt, Berlin	ETA-07/0260 / 2013-06-26
Assessment	MFPA Leipzig GmbH	GS 3.2/09-122 / 2010-05-26

a) All data given in this section according to the approvals mentioned above, ETA-09/0295 issue 2013-05-09 and ETA-07/0260 issue 2013-06-26.

Materials

Reinforcement bars according to EC2 Annex C Table C.1 and C.2N.

Properties of reinforcement

Product form		Bars and de-coiled rods	
Class		B	C
Characteristic yield strength f_{yk} or $f_{0,2k}$ (MPa)		400 to 600	
Minimum value of $k = (f_y/f_{y_k})$		$\geq 1,08$	$\geq 1,15$ $< 1,35$
Characteristic strain at maximum force, ε_{uk} (%)		$\geq 5,0$	$\geq 7,5$
Bendability		Bend / Rebend test	
Maximum deviation from nominal mass (individual bar) (%)	Nominal bar size (mm)	$\pm 6,0$ $\pm 4,5$	
≤ 8		$\pm 6,0$	
> 8		$\pm 4,5$	
Bond: Minimum relative rib area, $f_{R,min}$	Nominal bar size (mm)	0,040 0,056	
8 to 12		0,040	
> 12		0,056	

Setting details

For detailed information on installation see instruction for use given with the package of the product.

Curing time for general conditions

Data according ETA-09/0295, issue 2013-05-09			
Temperature of the base material	Working time in which rebar can be inserted and adjusted t_{gel}	Initial curing time $t_{cure,ini}$	Curing time before rebar can be fully loaded t_{cure}
5 °C ≤ $T_{BM} <$ 10 °C	2 h	18 h	72 h
10 °C ≤ $T_{BM} <$ 15 °C	90 min	12 h	48 h
15 °C ≤ $T_{BM} <$ 20 °C	30 min	9 h	24 h
20 °C ≤ $T_{BM} <$ 25 °C	20 min	6 h	12 h
25 °C ≤ $T_{BM} <$ 30 °C	20 min	5 h	12 h
30 °C ≤ $T_{BM} <$ 40 °C	12 min	4 h	8 h
$T_{BM} = 40$ °C	12 min	4 h	4 h

For dry concrete curing times may be reduced according to the following table. For installation temperatures below +5 °C all load values have to be reduced according to the load reduction factors given below.

Curing time for dry concrete

Additional Hilti technical data				
Temperature of the base material	Working time in which rebar can be inserted and adjusted t_{gel}	Initial curing time $t_{cure,ini}$	Reduced curing time before rebar can be fully loaded t_{cure}	Load reduction factor
$T_{BM} = -5$ °C	4 h	36 h	72 h	0,6
$T_{BM} = 0$ °C	3 h	25 h	50 h	0,7
$T_{BM} = 5$ °C	2 ½ h	18 h	36 h	1
$T_{BM} = 10$ °C	2 h	12 h	24 h	1
$T_{BM} = 15$ °C	1 ½ h	9 h	18 h	1
$T_{BM} = 20$ °C	30 min	6 h	12 h	1
$T_{BM} = 30$ °C	20 min	4 h	8 h	1
$T_{BM} = 40$ °C	12 min	2 h	4 h	1

Setting instruction

Safety Regulations:

Review the Material Safety Data Sheet (MSDS) before use for proper and safe handling!

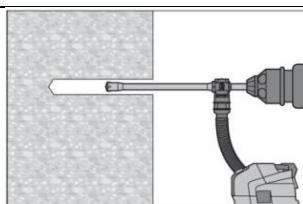

Wear well-fitting protective goggles and protective gloves when working with Hilti HIT-RE 500-SD.

Important: Observe the installation instruction of the manufacturer provided with each foil pack.

1. Drill hole

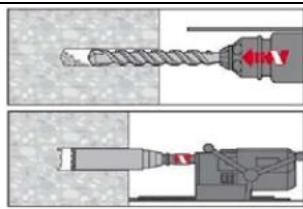

Note: Before drilling, remove carbonized concrete; clean contact areas (see Annex B1)

In case of aborted drill hole the drill hole shall be filled with mortar.

Drill hole to the required embedment depth with an appropriately sized Hilti TE-CD or TE-YD hollow drill bit with Hilti vacuum attachment.

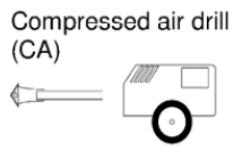

This drilling system removes the dust and cleans the bore hole during drilling when used in accordance with the user's manual. After drilling is complete, proceed to the "injection preparation" step in the instructions for use.

Drill the hole to the required embedment depth using a hammer-drill with carbide drill bit set in rotation hammer mode, a compressed air drill or a diamond core machine.

Hammer drill (HD)

Compressed air drill (CA)

Diamond core wet (DD) and dry (PCC)

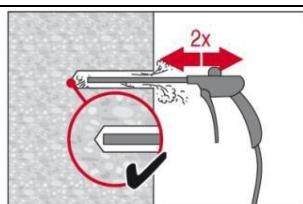

3. Bore hole cleaning

(Not needed with Hilti TE-CD and Hilti TE-YD drill bit)

The borehole must be free of dust, debris, water, ice, oil, grease and other contaminants prior to mortar injection.

Just before setting an anchor, the bore hole must be free of dust and debris by one of two cleaning methods described below

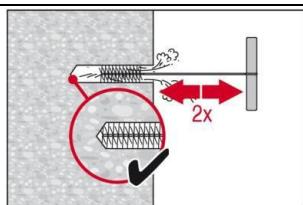

Compressed air cleaning (CAC)

Blowing

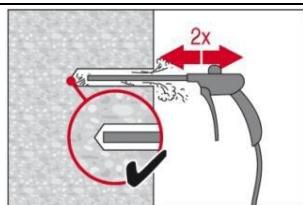

2 times from the back of the hole with oil-free compressed air (min. 6 bar at 100 litres per minute (LPM)) until return air stream is free of noticeable dust. Bore hole diameter \geq 32 mm the compressor must supply a minimum air flow of 140 m³/hour.

If required use additional accessories and extensions for air nozzle and brush to reach back of hole.

Brushing

2 times with the specified brush HIT-RB size (brush Ø \geq borehole Ø) by inserting the round steel brush to the back of the hole in a twisting motion. The brush shall produce natural resistance as it enters the anchor hole. If this is not the case, please use a new brush or a brush with a larger diameter.

Blowing

2 times again with compressed air until return air stream is free of noticeable dust.

If required use additional accessories and extensions for air nozzle and brush to reach back of hole.

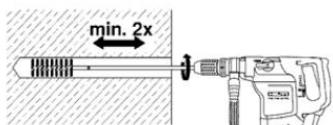

Deep boreholes – Blowing

For boreholes deeper than 250mm (for Ø=8mm – 12mm) or deeper than 20 Ø (for Ø>12mm) use the appropriate air nozzle Hilti HIT-DL

Safety tip: Do not inhale concrete dust.

The application of the dust collector Hilti HIT-DRS is recommended.

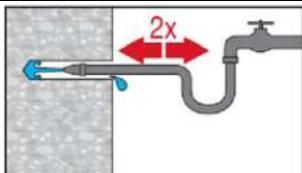

Deep boreholes – Brushing

For boreholes deeper than 250 mm (for Ø=8mm – 12mm) or deeper than 20 Ø (for Ø>12mm) use machine brushing and brush extensions HIT-RBS.

Screw the round steel brush HIT-RB in one end of the brush extension(s) HIT-RBS, so that the overall length of the brush is sufficient to reach the base of the borehole. Attach the other end of the extension to the TE-C/TE-Y chuck.

Safety tip:

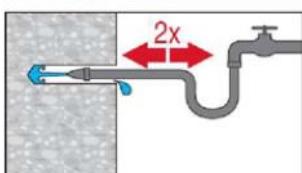

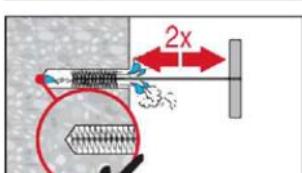

- Start machine brushing operational slowly.
- Start brushing operation once brush is inserted in borehole.

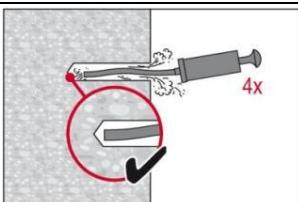

In addition for wet diamond coring (DD):

For wet diamond coring please observe the following steps in addition **prior to** compressed air cleaning:

Remove all core fragments from the anchor hole. Flush the anchor hole with clear running water until water runs clear. Brush the anchor hole again 2 times with the appropriate sized brush over the entire depth of the anchor hole. Repeat the flushing process until water runs out of the anchor hole.

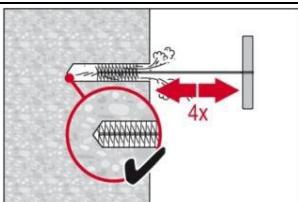

Manual Cleaning (MC) Manual cleaning is permitted for hammer drilled boreholes up to hole diameters $d_0 \leq 20\text{mm}$ and depths ℓ_v resp. $\ell_{e,\text{ges.}} \leq 160\text{mm}$.

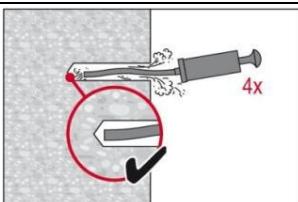

Blowing

4 strokes with Hilti blow-out pump from the back of the hole until return air stream is free of noticeable dust.

Brushing

4 times with the specified brush HIT_RB size (brush $\varnothing \geq$ borehole \varnothing) by inserting the round steel wire brush to the back of the hole with a twisting motion. The brush shall produce natural resistance as it enters the anchor hole. If this is not the case, please use a new brush or a brush with a larger diameter.

Blowing

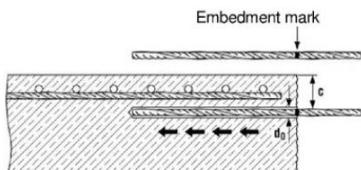

4 strokes with Hilti blow-out pump from the back of the hole until return air stream is free of noticeable dust.

Manual Cleaning (MC)

Hilti hand pump recommended for blowing out bore hole with diameters $d < 20\text{mm}$ and bore hole depth $h_0 < 160\text{mm}$

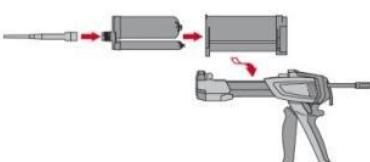

3. Rebar preparation and foil pack preparation

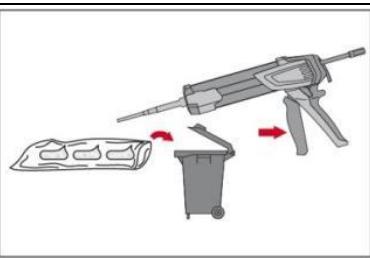

Before use, make sure the rebar is dry and free of oil or other residue.

Mark the embedment depth on the rebar. (e.g. with tape) , ℓ_v

Insert rebar in borehole, to verify hole and setting depth ℓ_v resp. $\ell_{e,\text{ges.}}$

- Observe the Instruction for Use of the dispenser and the mortar.
- Tightly attach Hilti HIT-RE-M mixing nozzle to foil pack manifold.
- Insert foil pack into foil pack holder and swing holder into the dispenser.

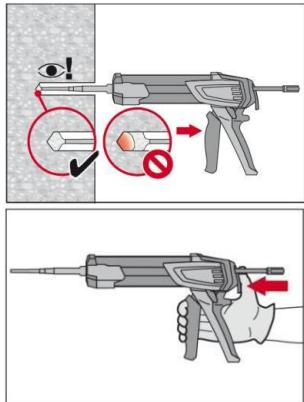

Discard initial mortar. The foil pack opens automatically as dispensing is initiated. Depending on the size of the foil pack an initial amount of adhesive has to be discarded.
After changing a mixing nozzle, the first few trigger pulls must be discarded as described above. For each new foil pack a new mixing nozzle must be used.

Discard quantities are

- 3 strokes for 330 ml foil pack,
- 4 strokes for 500 ml foil pack,
- 65 ml for 1400 ml foil pack,

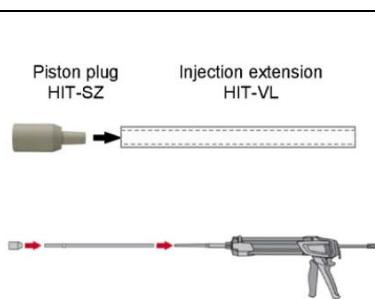

4.Inject mortar into borehole Forming air pockets be avoided

4.1 Injection method for borehole depth ≤ 250 mm

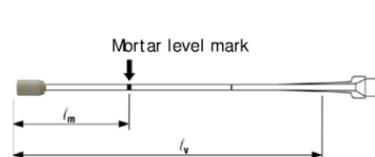

Inject the mortar from the back of the hole towards the front and slowly withdraw the mixing nozzle step by step after each trigger pull.
Fill holes approximately 2/3 full, or as required to ensure that the annular gap between the rebar and the concrete is completely filled with adhesive over the embedment length.
After injecting, depressurize the dispenser by pressing the release trigger. This will prevent further mortar discharge from the mixing nozzle.

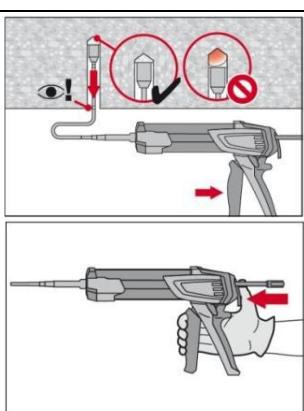

4.2 Injection method for borehole depth > 250 mm or overhead application

Assemble mixing nozzle HIT-RE-M, extension(s) and piston plug HIT-SZ.
For combinations of several injection extensions use coupler HIT-VL K. A substitution of the injection extension for a plastic hose or a combination of both is permitted.
The combination of HIT-SZ piston plug with HIT-VL 16 pipe and then HIT-VL 16 tube support proper injection.

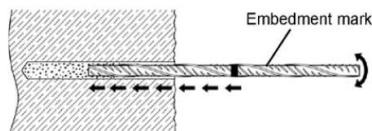

Mark the required mortar level l_m and embedment depth l_e , resp. $l_{e,ges}$ with tape or marker on the injection extension.

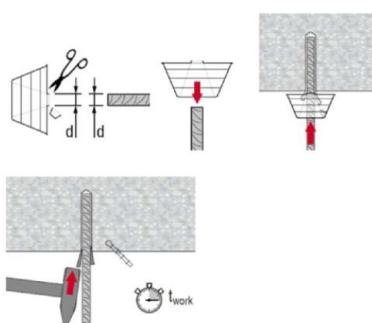

Insert piston plug to back of the hole. Begin injection allowing the pressure of the injected adhesive mortar to push the piston plug towards the front of the hole.
Fill holes approximately 2/3 full, or as required to ensure that the annular gap between the rebar and the concrete is completely filled with adhesive over the embedment length.
Injection until the morat level mark l_m becomes visible.
After injecting, depressurize the dispenser by pressing the release trigger. This will prevent further mortar discharge from the mixing nozzle.

5.Insert rebar

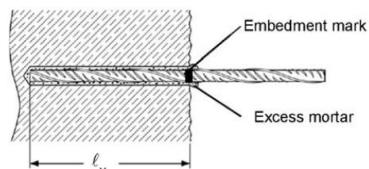

For easy installation insert the rebar slowly twisted into the borehole until the embedment mark is at the concrete surface level.

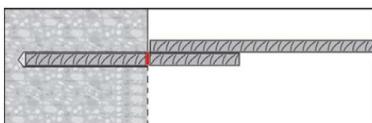

Overhead application:

During insertion of the rebar, mortar might flow out of the borehole. For collection of the flowing mortar, HIT-OHC may be used.

Support the rebar and secure it from falling till mortar started to harden, e.g. using wedges HIT-OHW.

After installing the rebar the annular gap must be completely filled with mortar.

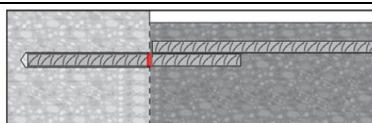

After installing the rebar the annular gap must be completely filled with mortar.

Proper installation can be verified when:

Desired anchoring embedment is reached l_v : embedment mark at concrete surface.

Excess mortar flows out of the borehole after the rebar has been fully inserted until the embedment mark.

Full load may be applied only after the curing time " t_{cure} " has elapsed.

Fitness for use

Some creep tests have been conducted in accordance with ETAG guideline 001 part 5 and TR 023 in the following conditions : in dry environment at 50 °C during 90 days.

These tests show an excellent behaviour of the post-installed connection made with HIT-RE 500-SD: low displacements with long term stability, failure load after exposure above reference load.

Resistance to chemical substances

Categories	Chemical substances	Resistant	Non resistant
Alkaline products	Drilling dust slurry pH = 12,6	+	
	Potassium hydroxide solution (10%) pH = 14	+	
Acids	Acetic acid (10%)		+
	Nitric acid (10%)		+
	Hydrochloric acid (10%)		+
	Sulfuric acid (10%)		+
Solvents	Benzyl alcohol		+
	Ethanol		+
	Ethyl acetate		+
	Methyl ethyl keton (MEK)		+
	Trichlor ethylene		+
	Xylol (mixture)	+	
Products from job site	Concrete plasticizer	+	
	Diesel	+	
	Engine oil	+	
	Petrol	+	
	Oil for form work	+	
Environnement	Sslt water	+	
	De-mineralised water	+	
	Sulphurous atmosphere (80 cycles)	+	

Electrical Conductivity

HIT-RE 500-SD in the hardened state **is not conductive electrically**. Its electric resistivity is $66 \cdot 10^{12} \Omega \cdot m$ (DIN IEC 93 – 12.93). It is adapted well to realize electrically insulating anchorings (ex: railway applications, subway).

Drilling diameters

Rebar (mm)	Drill bit diameters d_o [mm]

Pullout design bond strength for Hit Rebar design

**Design bond strength in N/mm² according to ETA 07/0260 (values in table are
design values, $f_{bd,po} = \tau_{RK}/\gamma_{Mp}$)**

Hammer or compressed air drilling.
Water saturated, water filled or submerged hole.
Uncracked concrete C20/25.

temperature range	Bar diameter													Hilti tech data	
	Data according to ETA 04/0027												Hilti tech data		
	8	10	12	14	16	20	22	24	25	26	28	30	32	36	40
I: 40°C/24°C	7,1			6,7			6,2						5,2	4,8	
II: 58°C/35°C	5,7			5,2						4,8			4,3	3,8	
III: 70°C/43°C	3,3			3,1						2,9			2,4		

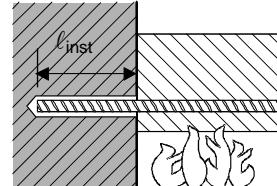

Increasing factor in non-cracked concrete: $f_{B,p} = (f_{ckk}/25)^{0,1}$ (f_{ckk} : characteristic compressive strength on cube)

Additional Hilti Technical Data:

If the concrete is dry (not in contact with water before/during installation and curing), the pullout design bond strength may be increased by 20%.

If the hole was produced by wet diamond coring, the pullout design bond strength has to be reduced by 30%.

Reduction factor for splitting with large concrete cover: $\delta = 0,306$ (Hilti additional data)

Fire Resistance**according to MFPA Leipzig, report GS 3.2/09-122****a) fire situation "anchorage"**

Maximum force in rebar in conjunction with HIT-RE 500 SD as a function of embedment depth for the fire resistance classes F30 to F240 (yield strength $f_{yk} = 500 \text{ N/mm}^2$) according EC2^{a)}.

b) bar connection parallel to slab or wall surface exposed to fire

Max. bond stress, τ_T , depending on actual clear concrete cover for classifying the fire resistance.

It must be verified that the actual force in the bar during a fire, $F_{s,T}$, can be taken up by the bar connection of the selected length, ℓ_{inst} . Note: Cold design for ULS is mandatory.

$$F_{s,T} \leq (\ell_{inst} - c_f) \cdot \phi \cdot \pi \cdot \tau_T \text{ where: } (\ell_{inst} - c_f) \geq \ell_s;$$

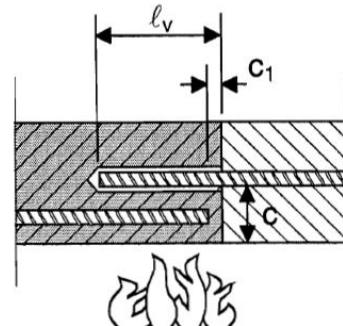

ℓ_s = lap length

ϕ = nominal diameter of bar

$\ell_{inst} - c_f$ = selected overlap joint length; this must be at least ℓ_s ,

but may not be assumed to be more than 80 ϕ

τ_T = bond stress when exposed to fire

Critical temperature-dependent bond stress, τ_c , concerning "overlap joint" for Hilti HIT-RE 500-SD injection adhesive in relation to fire resistance class and required minimum concrete coverage c .

Materials

Reinforcement bars according to EC2 Annex C Table C.1 and C.2N.

Properties of reinforcement

Product form		Bars and de-coiled rods	
Class		B	C
Characteristic yield strength f_{yk} or $f_{0,2k}$ (MPa)	400 to 600		
Minimum value of $k = (f_y/f_{y_k})_k$		$\geq 1,08$	$\geq 1,15$ $< 1,35$
Characteristic strain at maximum force, ε_{uk} (%)	$\geq 5,0$		
Bendability	Bend / Rebend test		
Maximum deviation from nominal mass (individual bar) (%)	Nominal bar size (mm)	$\pm 6,0$ $\pm 4,5$	
≤ 8		$\pm 6,0$	
> 8		$\pm 4,5$	
Bond: Minimum relative rib area, $f_{R,min}$	Nominal bar size (mm)	0,040 0,056	
8 to 12		0,040	
> 12		0,056	

Setting details

For detailed information on installation see instruction for use given with the package of the product.

Curing time for general conditions

Data according ETA-08/0105, issue 2014-04-30			
Temperature of the base material	Working time in which rebar can be inserted and adjusted t_{gel}	Initial curing time $t_{cure,ini}$	Curing time before rebar can be fully loaded t_{cure}
5 °C ≤ $T_{BM} <$ 10 °C	2 h	18 h	72 h
10 °C ≤ $T_{BM} <$ 15 °C	90 min	12 h	48 h
15 °C ≤ $T_{BM} <$ 20 °C	30 min	9 h	24 h
20 °C ≤ $T_{BM} <$ 25 °C	20 min	6 h	12 h
25 °C ≤ $T_{BM} <$ 30 °C	20 min	5 h	12 h
30 °C ≤ $T_{BM} <$ 40 °C	12 min	4 h	8 h
$T_{BM} = 40$ °C	12 min	4 h	4 h

For dry concrete curing times may be reduced according to the following table. For installation temperatures below +5 °C all load values have to be reduced according to the load reduction factors given below.

Curing time for dry concrete

Additional Hilti technical data				
Temperature of the base material	Working time in which rebar can be inserted and adjusted t_{gel}	Initial curing time $t_{cure,ini}$	Reduced curing time before rebar can be fully loaded t_{cure}	Load reduction factor
$T_{BM} = -5$ °C	4 h	36 h	72 h	0,6
$T_{BM} = 0$ °C	3 h	25 h	50 h	0,7
$T_{BM} = 5$ °C	2 ½ h	18 h	36 h	1
$T_{BM} = 10$ °C	2 h	12 h	24 h	1
$T_{BM} = 15$ °C	1 ½ h	9 h	18 h	1
$T_{BM} = 20$ °C	30 min	6 h	12 h	1
$T_{BM} = 30$ °C	20 min	4 h	8 h	1
$T_{BM} = 40$ °C	12 min	2 h	4 h	1

Setting instruction

Safety Regulations:

Review the Material Safety Data Sheet (MSDS) before use for proper and safe handling!

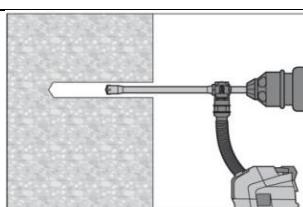

Wear well-fitting protective goggles and protective gloves when working with Hilti HIT-RE 500.

Important: Observe the installation instruction of the manufacturer provided with each foil pack.

1. Drill hole

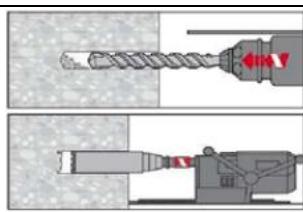

Note: Before drilling, remove carbonized concrete; clean contact areas (see Annex B1)

In case of aborted drill hole the drill hole shall be filled with mortar.

Drill hole to the required embedment depth with an appropriately sized Hilti TE-CD or TE-YD hollow drill bit with Hilti vacuum attachment.

This drilling system removes the dust and cleans the bore hole during drilling when used in accordance with the user's manual. After drilling is complete, proceed to the "injection preparation" step in the instructions for use.

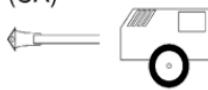

Drill the hole to the required embedment depth using a hammer-drill with carbide drill bit set in rotation hammer mode, a compressed air drill or a diamond core machine.

Hammer drill (HD)

Compressed air drill (CA)

Diamond core wet (DD) and dry (PCC)

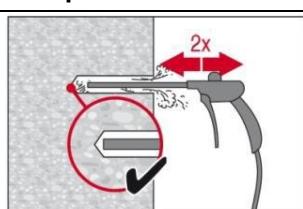

4. Bore hole cleaning

(Not needed with Hilti TE-CD and Hilti TE-YD drill bit)

The borehole must be free of dust, debris, water, ice, oil, grease and other contaminants prior to mortar injection.

Just before setting an anchor, the bore hole must be free of dust and debris by one of two cleaning methods described below

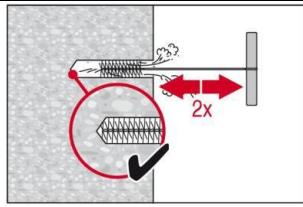

Compressed air cleaning (CAC)

Blowing

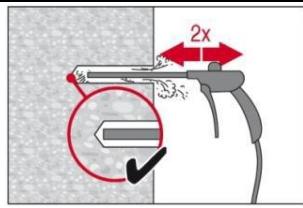

2 times from the back of the hole with oil-free compressed air (min. 6 bar at 100 litres per minute (LPM)) until return air stream is free of noticeable dust. Bore hole diameter \geq 32 mm the compressor must supply a minimum air flow of 140 m³/hour.

If required use additional accessories and extensions for air nozzle and brush to reach back of hole.

Brushing

2 times with the specified brush HIT-RB size (brush Ø \geq borehole Ø) by inserting the round steel brush to the back of the hole in a twisting motion. The brush shall produce natural resistance as it enters the anchor hole. If this is not the case, please use a new brush or a brush with a larger diameter.

Blowing

2 times again with compressed air until return air stream is free of noticeable dust.

If required use additional accessories and extensions for air nozzle and brush to reach back of hole.

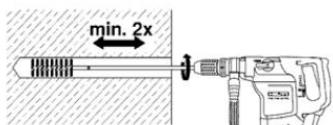

Deep boreholes – Blowing

For boreholes deeper than 250mm (for Ø=8mm – 12mm) or deeper than 20 Ø (for Ø>12mm) use the appropriate air nozzle Hilti HIT-DL

Safety tip: Do not inhale concrete dust.

The application of the dust collector Hilti HIT-DRS is recommended.

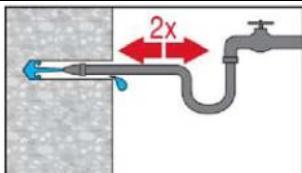

Deep boreholes – Brushing

For boreholes deeper than 250 mm (for Ø=8mm – 12mm) or deeper than 20 Ø (for Ø>12mm) use machine brushing and brush extensions HIT-RBS.

Screw the round steel brush HIT-RB in one end of the brush extension(s) HIT-RBS, so that the overall length of the brush is sufficient to reach the base of the borehole. Attach the other end of the extension to the TE-C/TE-Y chuck.

Safety tip:

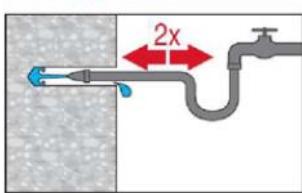

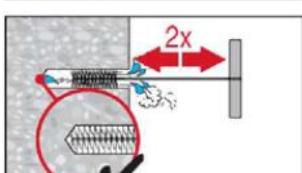

- Start machine brushing operational slowly.
- Start brushing operation once brush is inserted in borehole.

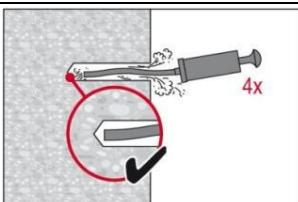

In addition for wet diamond coring (DD):

For wet diamond coring please observe the following steps in addition **prior to** compressed air cleaning:

Remove all core fragments from the anchor hole. Flush the anchor hole with clear running water until water runs clear. Brush the anchor hole again 2 times with the appropriate sized brush over the entire depth of the anchor hole. Repeat the flushing process until water runs out of the anchor hole.

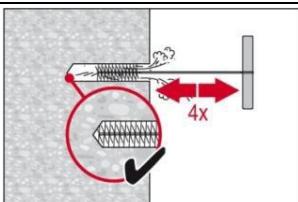

Manual Cleaning (MC) Manual cleaning is permitted for hammer drilled boreholes up to hole diameters $d_0 \leq 20\text{mm}$ and depths ℓ_v resp. $\ell_{e,\text{ges.}} \leq 160\text{mm}$.

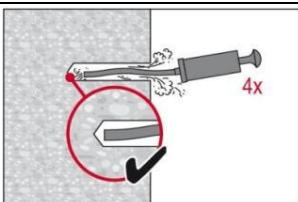

Blowing

4 strokes with Hilti blow-out pump from the back of the hole until return air stream is free of noticeable dust.

Brushing

4 times with the specified brush HIT_RB size (brush $\varnothing \geq$ borehole \varnothing) by inserting the round steel wire brush to the back of the hole with a twisting motion. The brush shall produce natural resistance as it enters the anchor hole. If this is not the case, please use a new brush or a brush with a larger diameter.

Blowing

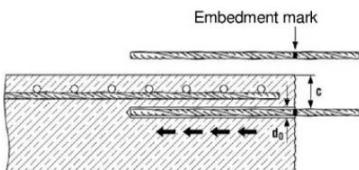

4 strokes with Hilti blow-out pump from the back of the hole until return air stream is free of noticeable dust.

Manual Cleaning (MC)

Hilti hand pump recommended for blowing out bore hole with diameters $d < 20\text{mm}$ and bore hole depth $h_0 < 160\text{mm}$

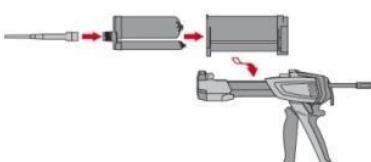

3. Rebar preparation and foil pack preparation

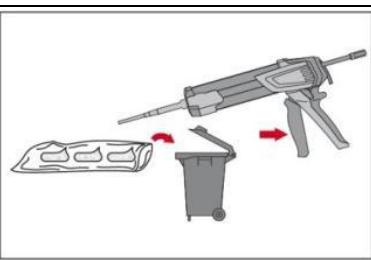

Before use, make sure the rebar is dry and free of oil or other residue.

Mark the embedment depth on the rebar. (e.g. with tape) , ℓ_v

Insert rebar in borehole, to verify hole and setting depth ℓ_v resp. $\ell_{e,\text{ges}}$

- Observe the Instruction for Use of the dispenser and the mortar.
- Tightly attach Hilti HIT-RE-M mixing nozzle to foil pack manifold.
- Insert foil pack into foil pack holder and swing holder into the dispenser.

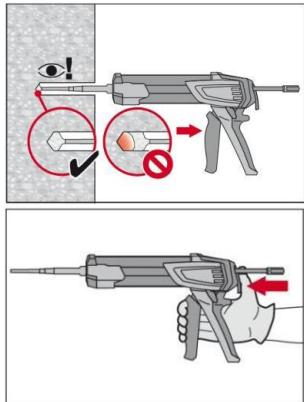

Discard initial mortar. The foil pack opens automatically as dispensing is initiated. Depending on the size of the foil pack an initial amount of adhesive has to be discarded.
After changing a mixing nozzle, the first few trigger pulls must be discarded as described above. For each new foil pack a new mixing nozzle must be used.

Discard quantities are

- 3 strokes for 330 ml foil pack,
- 4 strokes for 500 ml foil pack,
- 65 ml for 1400 ml foil pack,

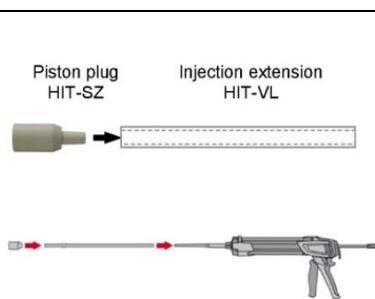

4.Inject mortar into borehole Forming air pockets be avoided

4.1 Injection method for borehole depth ≤ 250 mm

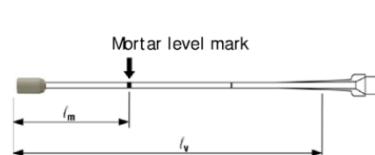

Inject the mortar from the back of the hole towards the front and slowly withdraw the mixing nozzle step by step after each trigger pull.
Fill holes approximately 2/3 full, or as required to ensure that the annular gap between the rebar and the concrete is completely filled with adhesive over the embedment length.
After injecting, depressurize the dispenser by pressing the release trigger. This will prevent further mortar discharge from the mixing nozzle.

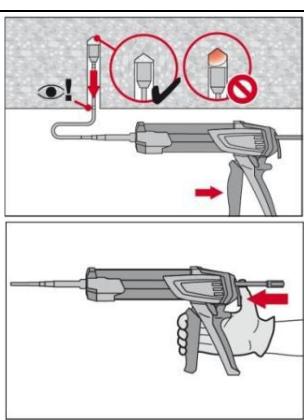

4.2 Injection method for borehole depth > 250 mm or overhead application

Assemble mixing nozzle HIT-RE-M, extension(s) and piston plug HIT-SZ.
For combinations of several injection extensions use coupler HIT-VL K. A substitution of the injection extension for a plastic hose or a combination of both is permitted.
The combination of HIT-SZ piston plug with HIT-VL 16 pipe and then HIT-VL 16 tube support proper injection.

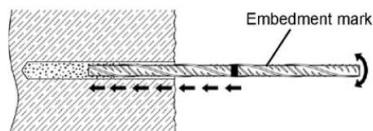

Mark the required mortar level l_m and embedment depth l_e resp. $l_{e,ges}$ with tape or marker on the injection extension.

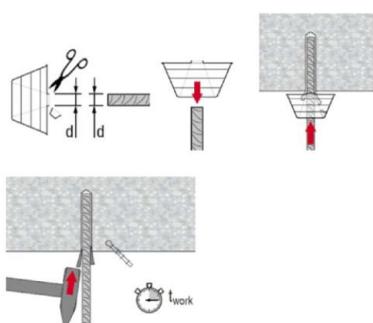

Insert piston plug to back of the hole. Begin injection allowing the pressure of the injected adhesive mortar to push the piston plug towards the front of the hole.
Fill holes approximately 2/3 full, or as required to ensure that the annular gap between the rebar and the concrete is completely filled with adhesive over the embedment length.
Injection until the morat level mark l_m becomes visible.
After injecting, depressurize the dispenser by pressing the release trigger. This will prevent further mortar discharge from the mixing nozzle.

5.Insert rebar

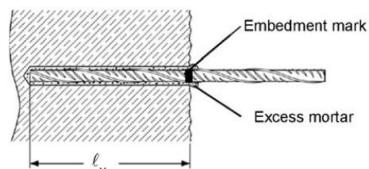

For easy installation insert the rebar slowly twisted into the borehole until the embedment mark is at the concrete surface level.

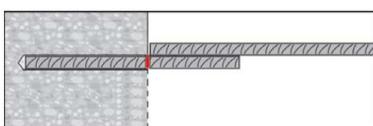

Overhead application:

During insertion of the rebar, mortar might flow out of the borehole. For collection of the flowing mortar, HIT-OHC may be used.

Support the rebar and secure it from falling till mortar started to harden, e.g. using wedges HIT-OHW.

After installing the rebar the annular gap must be completely filled with mortar.

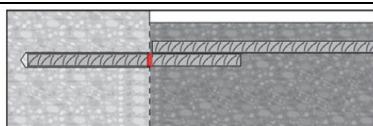

After installing the rebar the annular gap must be completely filled with mortar.

Proper installation can be verified when:

Desired anchoring embedment is reached l_v : embedment mark at concrete surface.

Excess mortar flows out of the borehole after the rebar has been fully inserted until the embedment mark.

Full load may be applied only after the curing time " t_{cure} " has elapsed.

Fitness for use

Some creep tests have been conducted in accordance with ETAG guideline 001 part 5 and TR 023 in the following conditions : in dry environment at 50 °C during 90 days.

These tests show an excellent behaviour of the post-installed connection made with HIT-RE 500: low displacements with long term stability, failure load after exposure above reference load.

Resistance to chemical substances

Categories	Chemical substances	resistant	Non resistant
Alkaline products	Drilling dust slurry pH = 12,6	+	
	Potassium hydroxide solution (10%) pH = 14	+	
Acids	Acetic acid (10%)		+
	Nitric acid (10%)		+
	Hydrochloric acid (10%)		+
	Sulfuric acid (10%)		+
Solvents	Benzyl alcohol		+
	Ethanol		+
	Ethyl acetate		+
	Methyl ethyl keton (MEK)		+
	Trichlor ethylene		+
	Xylol (mixture)	+	
Products from job site	Concrete plasticizer	+	
	Diesel	+	
	Engine oil	+	
	Petrol	+	
	Oil for form work	+	
Environnement	Sslt water	+	
	De-mineralised water	+	
	Sulphurous atmosphere (80 cycles)	+	

Electrical Conductivity

HIT-RE 500 in the hardened state **does not conduct electrically**. Its electric resistivity is $66 \cdot 10^{12} \Omega \cdot \text{m}$ (DIN IEC 93 – 12.93). It is adapted well to realize electrically insulating anchorings (ex: railway applications, subway).

Drilling diameters

Rebar (mm)	Drill bit diameters d_o [mm]			
	Hammer drill (HD) Hollow Drill Bit (HDB)	Compressed air drill (CA)	Diamond coring

Pullout design bond strength for Hit Rebar design

**Design bond strength in N/mm² according to ETA 04/0027 (values in table are
design values, $f_{bd,po} = \tau_{Rk}/\gamma_{Mp}$)**

Hammer or compressed air drilling.
Water saturated, water filled or submerged hole.
Uncracked concrete C20/25.

temperature range	Bar diameter													Hilti tech data	
	Data according to ETA 04/0027												Hilti tech data		
	8	10	12	14	16	20	22	24	25	26	28	30	32	36	40
I: 40°C/24°C	7,1			6,7			6,2						5,2	4,8	
II: 58°C/35°C	5,7			5,2			4,8						4,3	3,8	
III: 70°C/43°C	3,3			3,1			2,9						2,4		

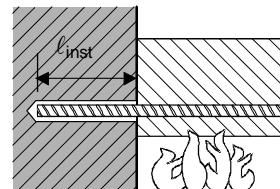

Increasing factor in non-cracked concrete: $f_{B,p} = (f_{ckk}/25)^{0,1}$ (f_{ckk} : characteristic compressive strength on cube)

Additional Hilti Technical Data:

If the concrete is dry (not in contact with water before/during installation and curing), the pullout design bond strength may be increased by 20%.

If the hole was produced by wet diamond coring, the pullout design bond strength has to be reduced by 30%.

Reduction factor for splitting with large concrete cover: $\delta = 0,306$ (Hilti additional data)

Fire Resistance according to DIBt Z-21.8-1790**a) fire situation “anchorage”**

Maximum force in rebar in conjunction with HIT-RE 500 as a function of embedment depth for the fire resistance classes F30 to F180 (yield strength $f_{yk} = 500 \text{ N/mm}^2$) according EC2^{a)}.

a) For tables according the standards to DIN 1045-1988, NF-ENV 1991-2-2(EC2), Österreichische Norm B 4700-2000, British-, Singapore- and Australian Standards see Warringtonfire report WF 166402 or/and IBMB Braunschweig report No 3357/0550-5.

b) fire situation parallel

Max. bond stress, τ_T , depending on actual clear concrete cover for classifying the fire resistance.

It must be verified that the actual force in the bar during a fire, $F_{s,T}$, can be taken up by the bar connection of the selected length, ℓ_{inst} . Note: Cold design for ULS is mandatory.

$$F_{s,T} \leq (\ell_{inst} - c_f) \cdot \phi \cdot \pi \cdot \tau_T \text{ where: } (\ell_{inst} - c_f) \geq \ell_s;$$

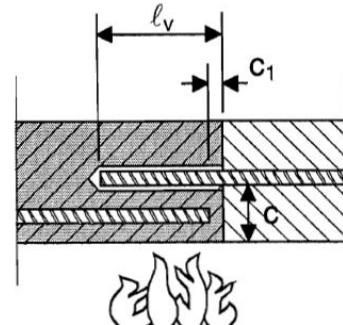

ℓ_s = lap length

ϕ = nominal diameter of bar

$\ell_{inst} - c_f$ = selected overlap joint length; this must be at least ℓ_s ,

but may not be assumed to be more than 80 ϕ

τ_T = bond stress when exposed to fire

Critical temperature-dependent bond stress, τ_c , concerning "overlap joint" for Hilti HIT-RE 500 injection adhesive in relation to fire resistance class and required minimum concrete coverage c.

Clear concrete cover c [mm]	Max. bond stress, τ_c [N/mm ²]

Materials

Reinforcement bars according to EC2 Annex C Table C.1 and C.2N.

Properties of reinforcement

Product form		Bars and de-coiled rods	
Class		B	C
Characteristic yield strength f_{yk} or $f_{0,2k}$ (MPa)	400 to 600		
Minimum value of $k = (f_u/f_y)_k$		$\geq 1,08$	$\geq 1,15$ $< 1,35$
Characteristic strain at maximum force, ε_{uk} (%)	$\geq 5,0$		
Bendability	Bend / Rebend test		
Maximum deviation from nominal mass (individual bar) (%)	Nominal bar size (mm)	$\pm 6,0$ $\pm 4,5$	
	≤ 8	$\pm 6,0$	
	> 8	$\pm 4,5$	
Bond: Minimum relative rib area, $f_{R,min}$	Nominal bar size (mm)	0,040 0,056	
	8 to 12	0,040	
	> 12	0,056	

Setting details

For detailed information on installation see instruction for use given with the package of the product.

Working time, curing time^{a)}

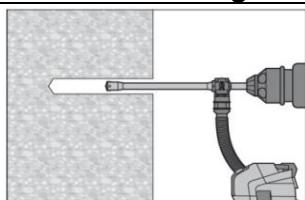

Temperature of the base material	HIT-HY 200-R	
	Working time in which anchor can be inserted and adjusted t_{work}	Curing time before anchor can be fully loaded t_{cure}
-10 °C to -5 °C	3 hour	20 hour
-4 °C to 0 °C	2 hour	7 hour
1 °C to 5 °C	1 hour	3 hour
6 °C to 10 °C	40 min	2 hour
11 °C to 20 °C	15 min	1 hour
21 °C to 30 °C	9 min	1 hour
31 °C to 40 °C	6 min	1 hour

Temperature of the base material	HIT-HY 200-A	
	Working time in which anchor can be inserted and adjusted t_{work}	Curing time before anchor can be fully loaded t_{cure}
-10 °C to -5 °C	1,5 hour	7 hour
-4 °C to 0 °C	50 min	4 hour
1 °C to 5 °C	25 min	2 hour
6 °C to 10 °C	15 min	1 hour
11 °C to 20 °C	7 min	30 min
21 °C to 30 °C	4 min	30 min
31 °C to 40 °C	3 min	30 min

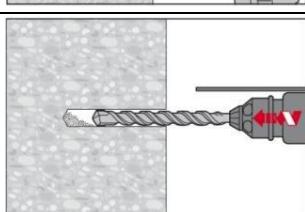

Setting instruction

a) Dry and water-saturated concrete, hammer drilling

Bore hole drilling

Drill hole to the required embedment depth with an appropriately sized Hilti TE-CD or TE-YD hollow drill bit with Hilti vacuum attachment. This drilling method properly cleans the borehole and removes dust while drilling. After drilling is complete, proceed to the "injection preparation" step in the instructions for use.

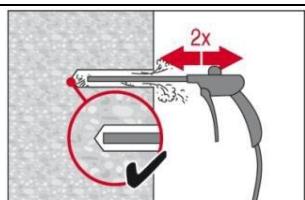

Drill hole to the required embedment depth using a hammer-drill with carbide drill bit set in rotation hammer mode, a Hilti hollow drill bit or a compressed air drill.

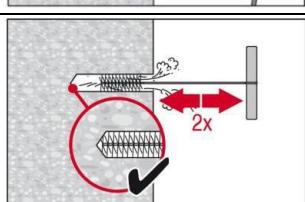

Bore hole cleaning Just before setting an anchor, the bore hole must be free of dust and debris by one of two cleaning methods described below

b) Compressed air cleaning (CAC)

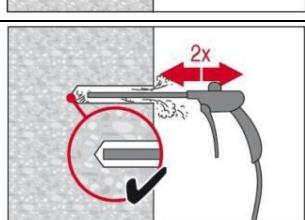

For all bore hole diameters d_0 and all bore hole depth h_0

Blowing 2 times from the back of the hole with oil-free compressed air (min. 6 bar at 100 litres per minute (LPM)) until return air stream is free of noticeable dust. Bore hole diameter ≥ 32 mm the compressor must supply a minimum air flow of 140 m³/hour.
If required use additional accessories and extensions for air nozzle and brush to reach back of hole.

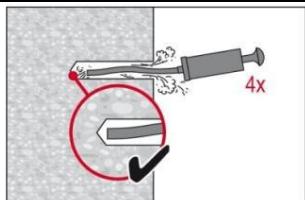

Brushing 2 times with the specified brush size (brush Ø \geq borehole Ø) by inserting the round steel brush to the back of the hole in a twisting motion. The brush shall produce natural resistance as it enters the anchor hole. If this is not the case, please use a new brush or a brush with a larger diameter.

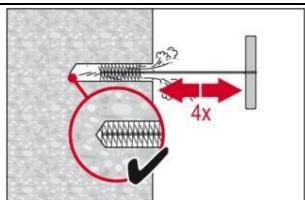

Blowing 2 times again with compressed air until return air stream is free of noticeable dust.

a) Manual Cleaning (MC)

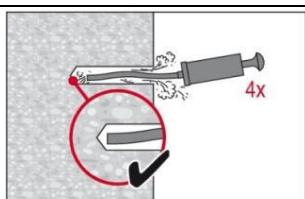

As an alternative to compressed air cleaning, a manual cleaning is permitted for hammer drilled boreholes up to hole diameters $d_0 \leq 20\text{mm}$ and depths ℓ_v resp. $\ell_{e,\text{ges.}} \leq 160\text{mm}$ or $10 * d$. The borehole must be free of dust, debris, water, ice, oil, grease and other contaminants prior to mortar injection.

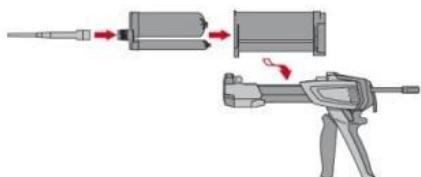

4 strokes with Hilti blow-out pump from the back of the hole until return air stream is free of noticeable dust.

4 times with the specified brush size (brush $\varnothing \geq$ borehole \varnothing) by inserting the round steel wire brush to the back of the hole with a twisting motion

4 strokes with Hilti blow-out pump from the back of the hole until return air stream is free of noticeable dust.

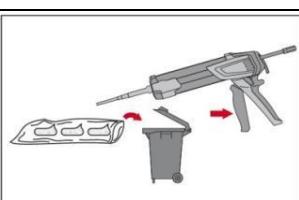

Injection preparation

Observe the Instruction for Use of the dispenser.

Observe the Instruction for Use of the mortar.

Tightly attach Hilti HIT-RE-M mixing nozzle to foil pack manifold.

Insert foil pack into foil pack holder and swing holder into the dispenser.

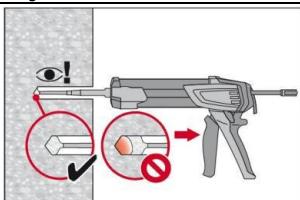

Discard initial adhesive. The foil pack opens automatically as dispensing is initiated. Depending on the size of the foil pack an initial amount of adhesive has to be discarded.

Discard quantities are

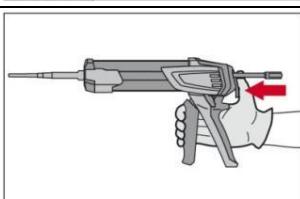

2 strokes for 330 ml foil pack,

3 strokes for 500 ml foil pack,

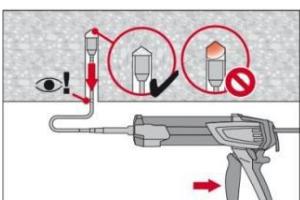

4 strokes for 500 ml foil pack $\leq 5^\circ\text{C}$.

Inject adhesive from the back of the borehole without forming air voids**Injection method for borehole depth ≤ 250 mm:**

Inject the mortar from the back of the hole towards the front and slowly withdraw the mixing nozzle step by step after each trigger pull. **Important!** **Use extensions for deep holes (> 250 mm).** Fill holes approximately 2/3 full, or as required to ensure that the annular gap between the rebar and the concrete is completely filled with adhesive over the embedment length.

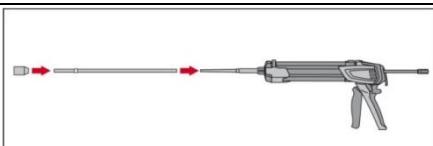

After injecting, depressurize the dispenser by pressing the release trigger (only for manual dispenser). This will prevent further mortar discharge from the mixing nozzle.

**Piston plug injection for borehole depth > 250 mm or overhead applications:**

Assemble mixing nozzle, extension(s) and appropriately sized piston plug. Insert piston plug to back of the hole. Begin injection allowing the pressure of the injected adhesive mortar to push the piston plug towards the front of the hole. After injecting, depressurize the dispenser by pressing the release trigger. This will prevent further mortar discharge from the mixing nozzle.

The proper injection of mortar using a piston plug HIT-SZ prevents the creation of air voids. The piston plug must be insertable to the back of the borehole without resistance. During injection the piston plug will be pressed towards the front of the borehole slowly by mortar pressure.

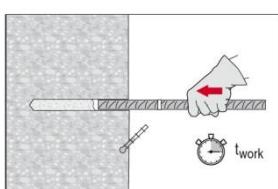

Attention! Pulling the injection or when changing the foil pack, the piston plug is rendered inactive and air voids may occur.

HDM 330 Manual dispenser (330 ml)

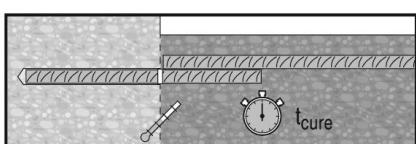

HDM 500 Manual dispenser (330 / 500 ml)

HDE 500-A22 Electric dispenser (330 / 500 ml)

Setting the element

Before use, verify that the element is dry and free of oil and other contaminants.

Mark and set element to the required embedment depth until working time t_{work} has elapsed.

After installing the rebar the annular gap must be completely filled with mortar.

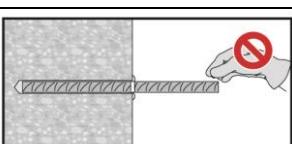

Proper installation can be verified when:

Desired anchoring embedment is reached ℓ_v :

Embedment mark at concrete surface.

Excess mortar flows out of the borehole after the rebar has been fully inserted until the embedment mark.

Overhead application: Support the rebar and secure it from falling till mortar started to harden.

Observe the working time " t_{work} ", which varies according to temperature of base material. Minor adjustments to the rebar position may be performed during the working time. After t_{cure} preparation work may continue.

For detailed information on installation see instruction for use given with the package of the product.

Resistance to chemical substances

Electrical Conductivity

HIT-HY 200 in the hardened state **is not conductive electrically**. Its electric resistivity is $15,5 \cdot 10^9 \Omega \cdot \text{cm}$ (DIN IEC 93 – 12.93). It is adapted well to realize electrically insulating anchorings (ex: railway applications, subway).

Basic design data for rebar design

Bond strength in N/mm² for good bond conditions for all drilling methods

Rebar (mm)	Concrete class								
	C12/15	C16/20	C20/25	C25/30	C30/37	C35/45	C40/50	C45/55	C50/60
8 - 25	1,6	2,0	2,3	2,7	3,0	3,0	3,0	3,4	3,7

Minimum anchorage length

The minimum anchorage length $\ell_{b,min}$ and the minimum lap length $\ell_{0,min}$ according to EN 1992-1-1:2004+AC:2010 ($\ell_{b,min}$ acc. to Eq. 8.6 and Eq. 8.7 and $\ell_{0,min}$ acc. to Eq. 8.11) shall be multiplied by a factor according to Table below.

Concrete class	Drilling method	Factor
C12/15 to C25/30	Hammer drilling (HD) and compressed air drilling (CA)	1,0
C30/37		1,1
C35/45 to C40/50		1,2
C45/55 to C50/60		1,3

Service temperature range

Hilti HIT-HY 110 injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

	Base material temperature	Maximum long term base material temperature	Maximum short term base material temperature
Temperature range	-40 °C to +80 °C	+50 °C	+80 °C

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

Fitness for use

Creep behaviour

Creep tests have been conducted in accordance with national standards in different conditions:

- in wet environment at 23 °C during 90 days
- in dry environment at 43 °C during 90 days.

These tests show an excellent behaviour of the post-installed connection made with HIT-HY 110: low displacements with long term stabilisation, failure load after exposure above reference load.

Basic design data for rebar design

Bond strength in N/mm² for good bond conditions for all drilling methods

Rebar (mm)	Concrete class								
	C12/15	C16/20	C20/25	C25/30	C30/37	C35/45	C40/50	C45/55	C50/60
8 – 24	1,6	2,0	2,3	2,7	3,0	3,4	3,4	3,4	3,7
25	1,6	2,0	2,3	2,7	3,0	3,4	3,7	3,7	3,7

Minimum anchorage length

The minimum anchorage length $\ell_{b,min}$ and the minimum lap length $\ell_{0,min}$ according to EN 1992-1-1:2004+AC:2010 ($\ell_{b,min}$ acc. to Eq. 8.6 and Eq. 8.7 and $\ell_{0,min}$ acc. to Eq. 8.11) shall be multiplied by a factor according to Table below.

Concrete class	Drilling method	Factor
C12/15 to C50/60	Hammer drilling and compressed air drilling	1,5

Service temperature range

Hilti HIT-HY 100 injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

	Base material temperature	Maximum long term base material temperature	Maximum short term base material temperature
Temperature range	-40 °C to +80 °C	+50 °C	+80 °C

Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

Fitness for use

Creep behaviour

Creep tests have been conducted in accordance with ETAG guideline 001 part 5 and TR 023 in the following conditions: in dry environment at 50 °C during 90 days.

These tests show an excellent behaviour of the post-installed connection made with HIT-HY 100: low displacements with long term stability, failure load after exposure above reference load.

Resistance to chemical substances

Chemical substance	Comment	Resistance
Sulphuric acid	23°C	+
Under sea water	23°C	+
Under water	23°C	+
Alkaline medium	pH = 13,2, 23°C	+

Precalculated values

Approvals / certificates

Description	Authority / Laboratory	No. / date of issue
European technical approval ^{a)}	CSTB, Paris	ETA-11/0390 / 2012-08-27
Fire test report	DiBT, Berlin	Z-21.8-2004

a) All data given in this section according ETA-11/0354 issue 2012-08-27.

Materials

Reinforcement bars according to EC2 Annex C Table C.1 and C.2N.

Properties of reinforcement

Product form		Bars and de-coiled rods	
Class		B	C
Characteristic yield strength f_{yk} or $f_{0,2k}$ (MPa)	400 to 600		
Minimum value of $k = (f_y/f_{yk})_k$		$\geq 1,08$	$\geq 1,15$ $< 1,35$
Characteristic strain at maximum force, ε_{uk} (%)		$\geq 5,0$	$\geq 7,5$
Bendability	Bend / Rebend test		
Maximum deviation from nominal mass (individual bar) (%)	Nominal bar size (mm)	$\pm 6,0$ $\pm 4,5$	
≤ 8		$\pm 6,0$ $\pm 4,5$	
> 8		$\pm 6,0$ $\pm 4,5$	
Bond: Minimum relative rib area, $f_{R,min}$	Nominal bar size (mm) 8 to 12 > 12	0,040 0,056	

Setting details

For detailed information on installation see instruction for use given with the package of the product.

Working time, Curing time

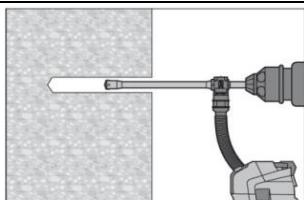

Temperature of the base material T_{BM}	Working time t_{gel}	Curing time t_{cure} ^{a)}
-5 °C $\leq T_{BM} <$ 0 °C	60 min	6 h
0 °C $\leq T_{BM} <$ 5 °C	40 min	3 h
5 °C $\leq T_{BM} <$ 10 °C	25 min	2 h
10 °C $\leq T_{BM} <$ 20 °C	10 min	90 min
20 °C $\leq T_{BM} <$ 30 °C	4 min	75 min
30 °C $\leq T_{BM} \leq$ 40 °C	2 min	60 min

- a) The curing time data are valid for dry anchorage base only. For water saturated anchorage bases the curing times must be doubled.

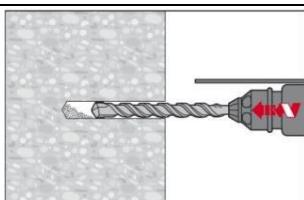

Setting instruction

Dry and water-saturated concrete, hammer drilling

Bore hole drilling

Drill hole to the required embedment depth with an appropriately sized Hilti TE-CD or TE-YD hollow drill bit with Hilti vacuum attachment. This drilling method properly cleans the borehole and removes dust while drilling. After drilling is complete, proceed to the "injection preparation" step in the instructions for use.

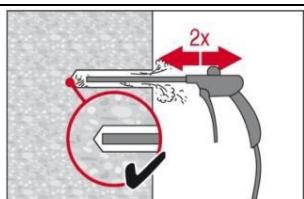

Drill hole to the required embedment depth using a hammer-drill with carbide drill bit set in rotation hammer mode, a Hilti hollow drill bit or a compressed air drill.

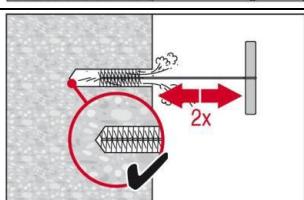

Bore hole cleaning

Just before setting an anchor, the bore hole must be free of dust and debris by one of two cleaning methods described below

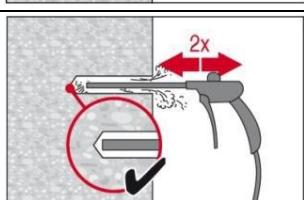

a) Compressed air cleaning (CAC) For all bore hole diameters d_0 and all bore hole depth h_0

Blowing 2 times from the back of the hole with oil-free compressed air (min. 6 bar at 100 litres per minute (LPM)) until return air stream is free of noticeable dust. Bore hole diameter ≥ 32 mm the compressor must supply a minimum air flow of 140 m³/hour.
If required use additional accessories and extensions for air nozzle and brush to reach back of hole.

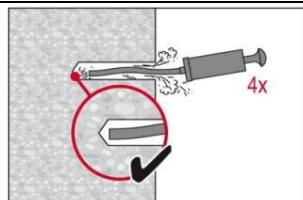

Brushing 2 times with the specified brush size (brush $\varnothing \geq$ borehole \varnothing) by inserting the round steel brush to the back of the hole in a twisting motion. The brush shall produce natural resistance as it enters the anchor hole. If this is not the case, please use a new brush or a brush with a larger diameter.

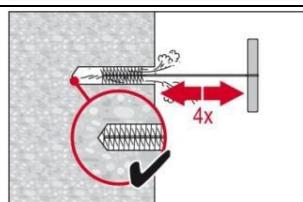

Blowing 2 times again with compressed air until return air stream is free of noticeable dust.

b) Manual Cleaning (MC)

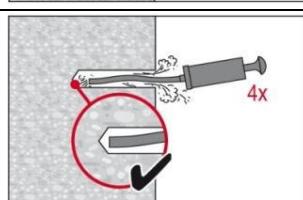

As an alternative to compressed air cleaning, a manual cleaning is permitted for hammer drilled boreholes up to hole diameters $d_0 \leq 20\text{mm}$ and depths ℓ_v resp. $\ell_{e,\text{ges.}} \leq 160\text{mm}$ or 10^*d . The borehole must be free of dust, debris, water, ice, oil, grease and other contaminants prior to mortar injection.

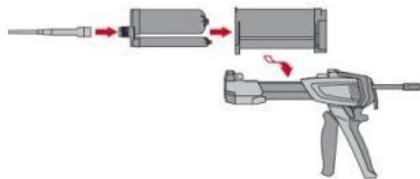

4 strokes with Hilti blow-out pump from the back of the hole until return air stream is free of noticeable dust.

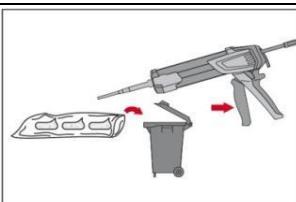

4 times with the specified brush size (brush $\varnothing \geq$ borehole \varnothing) by inserting the round steel wire brush to the back of the hole with a twisting motion. The brush shall produce natural resistance as it enters the anchor hole. If this is not the case, please use a new brush or a brush with a larger \varnothing ,

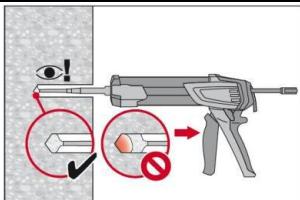

4 strokes with Hilti blow-out pump from the back of the hole until return air stream is free of noticeable dust.

Injection preparation

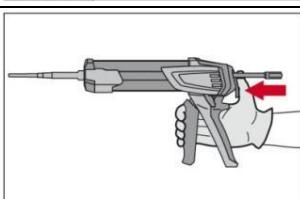

Observe the Instruction for Use of the dispenser.
Observe the Instruction for Use of the mortar.
Tightly attach Hilti HIT-RE-M mixing nozzle to foil pack manifold.
Insert foil pack into foil pack holder and swing holder into the dispenser.

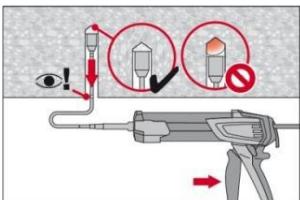

Discard initial adhesive. The foil pack opens automatically as dispensing is initiated. Depending on the size of the foil pack an initial amount of adhesive has to be discarded.
Discard quantities are
2 strokes for 330 ml foil pack
3 strokes for 500 ml foil pack

Inject adhesive from the back of the borehole without forming air voids**Injection method for borehole depth ≤ 250 mm:**

Inject the mortar from the back of the hole towards the front and slowly withdraw the mixing nozzle step by step after each trigger pull. **Important!** **Use extensions for deep holes > 250 mm.** Fill holes approximately 2/3 full, or as required to ensure that the annular gap between the rebar and the concrete is completely filled with adhesive over the embedment length.

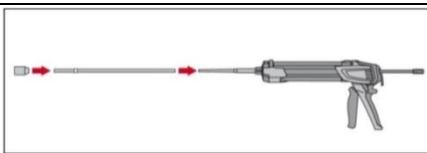

After injecting, depressurize the dispenser by pressing the release trigger (only for manual dispenser). This will prevent further mortar discharge from the mixing nozzle.

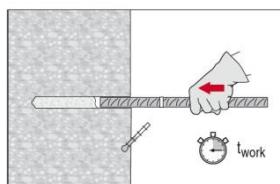

**Piston plug injection for borehole depth > 250 mm or overhead applications:**

Assemble mixing nozzle, extension(s) and appropriately sized piston plug. Insert piston plug to back of the hole. Begin injection allowing the pressure of the injected adhesive mortar to push the piston plug towards the front of the hole. After injecting, depressurize the dispenser by pressing the release trigger. This will prevent further mortar discharge from the mixing nozzle.

The proper injection of mortar using a piston plug HIT-SZ prevents the creation of air voids. The piston plug must be insertable to the back of the borehole without resistance. During injection the piston plug will be pressed towards the front of the borehole slowly by mortar pressure. Attention! Pulling the injection or when changing the foil pack, the piston plug is rendered inactive and air voids may occur.

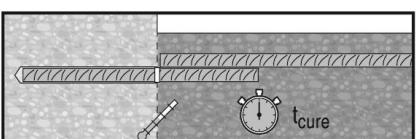

**Dispenser types with related foil pack sizes:**

HDM 330	Manual dispenser (330 ml)
HDM 500	Manual dispenser (330 / 500 ml)
HDE 500-A22	Electric dispenser (330 / 500 ml)

Setting the element

Before use, verify that the element is dry and free of oil and other contaminants.

Mark and set element to the required embedment depth until working time t_{work} has elapsed.

After installing the rebar the annular gap must be completely filled with mortar.

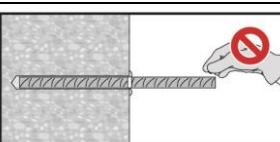

Proper installation can be verified when:

Desired anchoring embedment is reached ℓ_v :

Embedment mark at concrete surface.

Excess mortar flows out of the borehole after the rebar has been fully inserted until the embedment mark.

Overhead application: Support the rebar and secure it from falling till mortar started to harden.

Observe the working time " t_{work} ", which varies according to temperature of base material. Minor adjustments to the rebar position may be performed during the working time. After t_{cure} preparation work may continue.

For detailed information on installation see instruction for use given with the package of the product.

Fitness for use**Creep behaviour**

Creep tests have been conducted in dry environment at 50°C during 90 days.

These tests show an excellent behaviour of the post installed connection made with HIT-CT 1: low displacements with long term stabilisation, failure load after exposure above reference load.

Resistance to chemical substances

Chemical	Resistance	Chemical	Resistance
Acetic acid 100%	o	Methanol 100%	o
Acetic acid 10%	+	Peroxide of hydrogen 30%	o

Rail anchoring systems

Introduction

Bottom-up – post-installed method

Top-down – cast-in method

Introduction to Hilti rail anchoring systems

1 The Hilti direct fixation (DFF) generation for bottom-up, top-down, elastic and rigid applications

Hilti offers solution for both construction methods, Top-down (cast-in) and bottom up (post-installed) construction method.

Bottom-up is described as the concrete slab is poured first. The rail is set in position while all associated components are clipped to the rail besides Hilti DFF. The holes for anchors are cored in the top of the slab while the holes in the baseplates are used as drilling pattern (high accuracy). Afterwards the borehole is filled with Hilti injection mortar and Hilti DFF are inserted into the mortar filled borehole

Bottom-up construction method	Hilti direct fixation fastener
--------------------------------------	---------------------------------------

Top down is described as the rail is set and supported on props in the correct position. Baseplates and all associated components (clips, Hilti rail anchors, etc.) are clipped to the rail while the concrete is then poured up to a given level or the underside of the baseplate.

Top down construction method

Clipped components
before concrete
pouring

Support after
concrete pouring

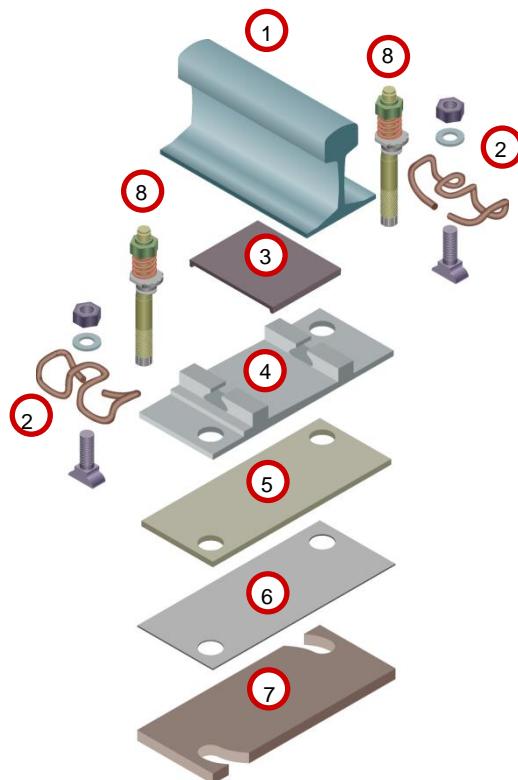

Hilti provides elastic fasteners if elastomeric pads are situated between rib plate and concrete surface. The necessary movement of the baseplate is ensured by Hilti DFF adapted with compression springs **9** which will be pre-tensioned during installation.

Hilti provides rigid systems if no elastomeric pads are situated between rib plate and concrete surface (tram washes, depots) where the baseplate will not move up and down in the area of the anchors. Hilti rigid rail anchors are also used if **sandwich base-plates or so called floating plates** should be fastened.

This boundary condition is taken into account by equipping Hilti rail anchors with spring washers (rigid) **10**

2 Hilti direct fixation fasteners ensure that major components of a modular baseplate support works

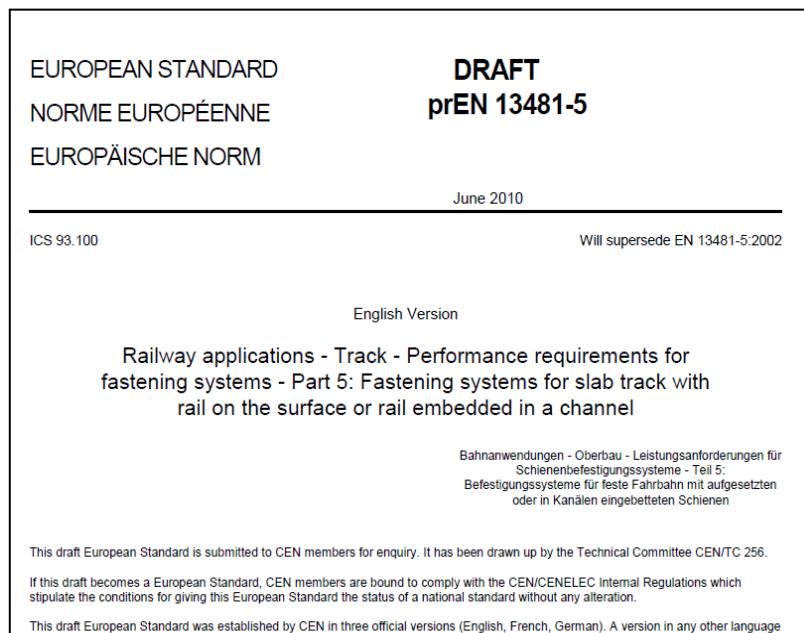

- ① Rail to provide guide way for rolling stocks
- ② To secure the rail to the baseplate in general two pieces of **elastic clips** fitted with electrical insulation are used. The elastic clips ensure sufficient force transfer to the rail to restrain longitudinal movement of the rail. These are attached to the baseplate via T-bolts including nut and washer.
- ③ The **rail pad** is located between the rail and baseplate to reduce abrasion as the rail moves with temperature.
- ④ The **baseplate/rib plate** may be steel iron plates which seat the rail foot and provide anchoring points for the Hilti rail anchors and clips. The baseplate also incline the rail towards the center of the track either by an angle of 1:20 or 1:40 due to the conical wheel thread of the wheels on the rail.
- ⑤ The **elastic pad** is providing the necessary elasticity between the baseplate and concrete slab and manages resilience in terms of noise and vibration.
- ⑥ **Shims** are packing pieces of varying thickness to accommodate variations in the concrete surface located between the elastic pad and concrete surface.
- Additional **non-shrink Hilti epoxy grout** (Hilti CB-G EG) can be used to accommodate concrete surface irregularities.
- ⑧ **Hilti direct fixation fasteners** (2 or 4 pics. per baseplate) to provide a reliable load transfer from the support into the slab (concrete sleepers)

3 State-of-the art testing while Hilti direct fixation fasteners are going beyond

Hilti Rail anchors are tested by third party according to the new European standard DIN EN 13481-5 and the former standards¹⁾. Therefore Hilti rail anchors provide:

- **Sufficient fatigue resistant** (repeated loading) to ensure that the horizontal guidance forces are transferred from the rail to the base material, see section 4
- **Sufficient electrical resistance** to avoid stray current, see section 5
- the possibility of **dismantling the complete support after exposure** to severe environmental conditions
- **Sufficient tension resistance**, see section 6

European standard for performance requirements for fastening systems – Part 5: Fastening systems for slab track with rail on the surface or rail embedded in channel

Hilti rail anchors go beyond the scope and requirements of DIN EN 13481-5 by means of tested under not expected concrete conditions (cracks in slab track), installation safety, electrical insulation and highest loads.

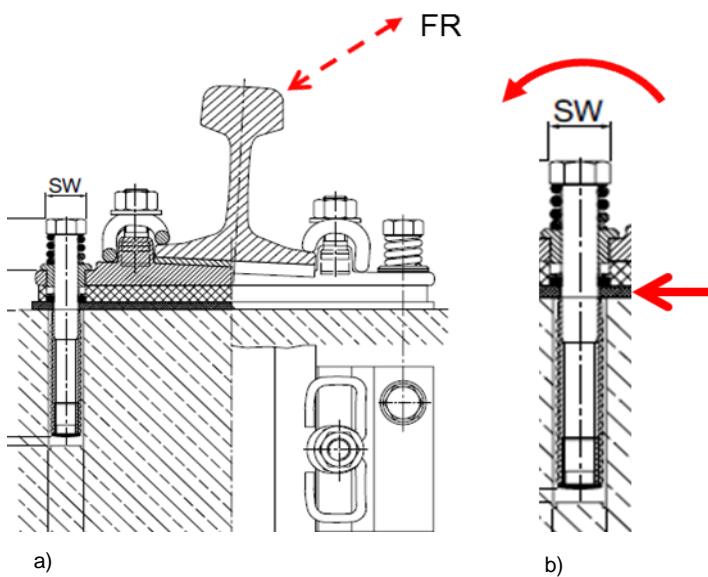

1) Testing recommended by the Research and Test Establishment of the International Railway association ORE or ERRI (see also CEN/TC, Part 4 «Railway applications – permanent way, test methods for fastening systems/biaxial load test, June 1996).

4 Hilti DFF keep position even under high fatigue loading

Forces acting on the rail (F_R) by rolling stock are loading Hilti direct fixation fasteners under shear by means of cantilever bending. The orientation and value of the forces are taken account by the DIN EN 13481-5 and the former standards¹⁾ in a realistic way based on axle load of the rolling stock, maximum speed and curve radii.

All Hilti rail anchor resist more than 3×10^6 load cycles under the tested boundary conditions without showing any damage.

Due to High steel strength and manufacturing quality Hilti direct fixation fasteners cover the largest lever arm possible to provide you the most flexible solution concerning load and fixing height. In general only 2 anchors per baseplate are needed (straight track). This results in less installation time and costs in combination with a reliable solution.

- a) Cross section and inclined load F_R by rolling stock
- b) Cantilever bending of Hilti direct fixation fasteners by means of shear force and moment

Hilti rail anchor goes beyond !

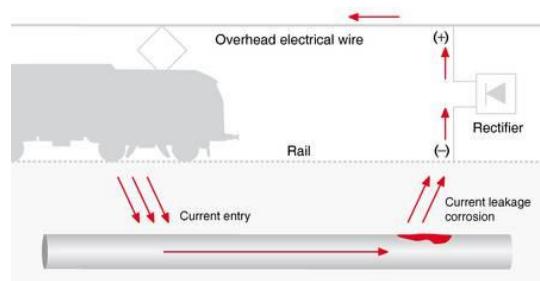

While the axle load of DIN EN 13481-5 is limited to 250 kN (25tons), Hilti showed that the HRC rail anchor family resists axle loads up to 390 kN (39tons) without showing any damage.

We do not believe in plastic if it comes to load transfer

All parts of Hilti rail anchors which are taking up tension load and/or bending moment are made out of high strength steel to ensure a reliable load transfer mechanism.

5 Hilti rail anchors brings electrical current to the intended path

Stray currents can be described as electrical current which do not follow the intended path. Effectively stray currents are electrical charges leaking into the ground while the hazard of stray currents emerges whenever this rogue DC charge comes into contact with anything metallic, whereupon it will begin the corrosion process (e.g. pipes).

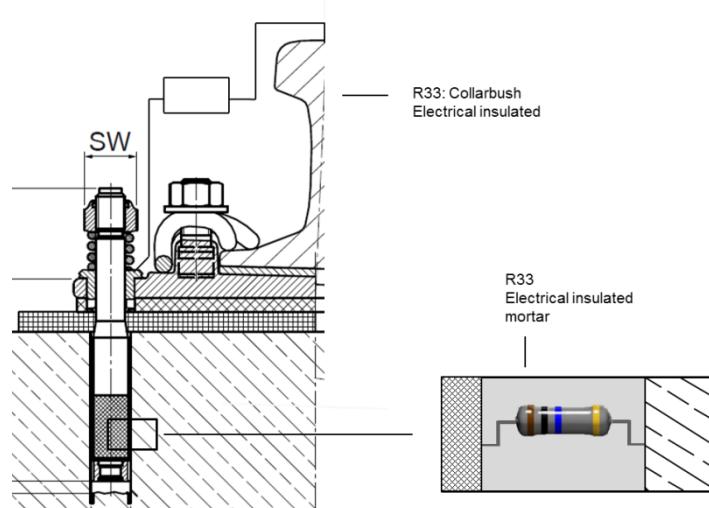

Stray current acting on a metallic pipe

One part of reducing stray current such as rail-to-earth resistance can be controlled via Hilti rail anchors by combining Hilti electrical resistance mortar (HIT RE 500 & HIT RE 500 SD) with Hilti electrical resistance collar bushes.

The European standard is measuring the electrical insulation during test, the minimum required resistance value is $R_{33}= 5.0\text{k}\Omega$ (wet conditions),

With Hilti rail anchors always $5.0\text{k}\Omega < R_{33} \leq 33\text{ k}\Omega$ were achieved based on the used system.

6 The state-of the art testing standard DIN EN 13481-5

According to DIN EN 13481-5 "Railway applications – Track – Performance requirements for fastening systems – Part 5: Fastening systems for slab track with rail on surface or rail embedded in a channel", direct fixation fasteners should in addition resist a tension load of 60 kN for 3 minutes. However it is not clearly stated if these pullout tests should be performed after or before the fatigue tests by means of 3 Mio. load cycles.

This is clear for us. Providing top quality direct fixation fasteners Hilti performs the discussed pullout test after and with the already fatigue loaded anchor to take account of all conditions in a realistic way

With Hilti direct fixation fasteners pullout loads of up to 150 kN after fatigue loading are measured.

HRT-WH Rail anchor with Hilti HVU or Hilti HIT-RE 500

Fastening system	Benefits

Hilti HRT-I (rigid) Rail Anchor**Bolt (M22, SW32)**

Material: 10.9 (DIN 931,EN ISO 4014,), hot dipped galvanized
Head: Hexagonal

Spring washer (22.5/35.9/4.0)

Wire Grade: C7 (DIN 2076), blue zinc plated: Fe/Zn 10B (DIN 50961), deformation: 4mm

Washer (23.0/44.0/4.0)

Material: 4.8 (DIN 125), blue zinc plated: Fe/Zn 10B (DIN 50961)
Int. Ø= 23 mm, Ext. Ø= 44 mm

Collar Bush

Material: Plastic, int. Ø: 22.2 mm, ext. Ø: 24.2 mm; collar Ø: 44 mm, height: 2/12/14 mm to provide insulation against stray current.

Sealingwasher (22.0/36.0/5.0)

PE-Hard foam LD29, black, to prevent any excess injection mortar HIT-RE on the anchor shaft.

Insert Body (Ø 28 mm)

Material: carbon steel (DIN/ISO 898/1), blue zinc plated: Fe/Zn 10B (DIN 50961), designed for an embedment of 120 mm

Bolt (M27, SW41)

Material: 8.8 (DIN 931,EN ISO 4014), blue zinc plated: Fe/Zn 10B (DIN 50961)
Head: Hexagonal

Spring washer (27.5/41.5/5.0)

Wire Grade: C7 (DIN 2076), blue zinc plated: Fe/Zn 10B (DIN 50961), deformation: 4mm

Washer (28.0/49.0/4.0)

Material: 4.8 (DIN 125), blue zinc plated: Fe/Zn 10B (DIN 50961)
Int. Ø= 28 mm, Ext. Ø= 49 mm

Collar Bush

Material: Plastic, int. Ø: 27.2 mm, ext. Ø: 30.5 mm; collar Ø: 49 mm, height: 2/12/14 mm to provide insulation against stray current.

Sealingwasher (27.0/36.0/5.0)

PE-Hard foam LD29, black, to prevent any excess injection mortar HIT-RE on the anchor shaft.

Insert Body (Ø 33 mm)

Material: carbon steel (DIN/ISO 898/1), blue zinc plated: Fe/Zn 10B (DIN 50961), designed for an embedment of 150 mm

HRT-IP Rail Anchor for cast-in/top down construction method

Fastening system	Benefits
	<p>Hilti HRT-IP (elastic)</p> <ul style="list-style-type: none">- for fastening rails to concrete slab track- for top-down (cast-in) construction method- verified for axle loads up to 250 kN- high electrical insulation values concerning stray currency- corrosion resistance- with spring (elastic) or spring washer (rigid)- additional accessories available different support stiffness- fixing plate to support assembling- bolt removable- identical system for post-installed/bottom up construction method available (HRT-I) → Rehabilitation- 2 and 4 anchor configuration
	<p>Hilti HRT-IP (rigid)</p> <ul style="list-style-type: none">- for fastening rails to concrete slab track- for top-down (cast-in) construction method- verified for axle loads up to 250 kN- high electrical insulation values concerning stray currency- corrosion resistance- with spring (elastic) or spring washer (rigid)- additional accessories available different support stiffness- fixing plate to support assembling- bolt removable- identical system for post-installed/bottom up construction method available (HRT-I) → Rehabilitation- 2 and 4 anchor configuration

Approvals / certificates

Description	Authority / Laboratory	No. / date of issue
Rail anchor testing	Technical University of Munich	Report no. 2824 / 2011-12-21
		Report no. 2883 / 2012-05-21

Application field covered

Selection of Hilti rail anchors for fastening rails to concrete track slab, based on axle load (A), stiffness (c) and thickness (t) of elastic pad

Anchor *	Elastic pad, t (mm)**	Tramway A = 100 kN	Metro A = 135 kN	Commuter A = 180 kN	Full Size A = 250 kN
HRT- IP M22	15	○	○	○	-
	25	○	○	○	-
HRT – IP M27	10	○	○	○	○
	20	○	○	○	○
	30	○	○	○	-
	V _{max}	60 km/h	80 km/h	120 km/h	≥250 km/h
Criteria	R _{min} (V _{max})***	70 m (25 km/h)	200 m (60 km/h)	300 m (80 km/h)	3000 m
	Support spacing	750 mm	750 mm	700 mm	650 mm

* Configuration of base plate (support): ○ = Anchors per support

** Stiffness of elastic pad:
 t = 10mm -> c = 20-30 kN/mm
 t = 20mm -> c = 10-20 kN/mm
 t = 30mm -> c = 5-10 kN/mm

*** Indicative value: V_{max} is a function of the existing superelevation (cant) and the lateral acceleration.

Setting details	HRT-IP M22x190/HRT-IP M27x240		
Anchor	HRT-IP M22	HRT-IP M27	
Embedment depth h _{nom} [mm]	120	150	
Minimum member thickness h _{min} [mm]	-	-	
Length of anchor l [mm]	160	200	
Maximum fixing height t _{fix} [mm]	-	-	
Spring deflection S _{inst} [mm]	8	10	
Spring length L _{st} [mm]	35	40	
Wrench size S _{inst} [mm]	38	41	

Specification

Hilti HRT-IP (elastic) Rail Anchor	
	<p>Bolt (M22, SW32) Material: 10.9 (DIN 931,EN ISO 4014,), hot dipped galvanized Head: Hexagonal</p> <p>Spring (35 mm) Wire Grade: C7 (DIN 2076), yellow zinc plated: Fe/Zn 7C (DIN 50961), Spring rate: 373 N/mm, deformation: 8mm</p> <p>Collar Bush Material: Plastic , int. Ø= 27 mm, ext. Ø= 36 mm Volume resistivity: $1.2 \times 10^{12} \Omega \text{ cm}$</p> <p>Sealingwasher (22.0/36.0/5.0) To prevent any excess concrete on the anchor shaft</p> <p>Fixing plate (26.2/50.0/2.0) To fix the rigid pad (HDPE) and elastic pad to the support assembling during concrete slab pouring.</p> <p>Insert Body (Ø 28 mm) Material: carbon steel (DIN/ISO 898/1), blue zinc plated: Fe/Zn 10B (DIN 50961), designed for an embedment of 120 mm</p> <p>Bolt (M27, SW41) Material: 8.8 (DIN 931,EN ISO 4014), Blue Zinc Plated: Fe/Zn 10B (DIN 50961) Head: Hexagonal</p> <p>Spring (40 mm) Wire Grade: C7 (DIN 2076), Yellow Zinc Plated: Fe/Zn 7C (DIN 50961), spring Rate: 300 N/mm, deformation: 10mm → 3.0 kN compression</p> <p>Collar Bush Material: Plastic , int. Ø= 28 mm, ext. Ø= 36 mm Volume resistivity: $1.2 \times 10^{12} \Omega \text{ cm}$</p> <p>Sealingwasher (27.0/36.0/5.0) To prevent any excess concrete on the anchor shaft</p> <p>Fixing plate (31.2/50.0/2.0) To fix the rigid pad (HDPE) and elastic pad to the support assembling during concrete slab pouring.</p> <p>Insert Body (Ø 33 mm) Material: Carbon steel (DIN/ISO 898/1), blue zinc plated: Fe/Zn 10B (DIN 50961), designed for an embedment of 150 mm</p>

Hilti HRT-IP (rigid) Rail Anchor**Bolt (M22, SW32)**

Material: 10.9 (DIN 931,EN ISO 4014.), hot dipped galvanized
Head: Hexagonal

Spring washer (22.5/35.9/4.0)

Wire Grade: C7 (DIN 2076), blue zinc plated: Fe/Zn 10B (DIN 50961), deformation: 4mm

Washer (23.0/44.0/4.0)

Material: 4.8 (DIN 125), blue zinc plated: Fe/Zn 10B (DIN 50961)
Int. Ø= 23 mm, Ext. Ø= 44 mm

Collar Bush

Material: Plastic, int. Ø: 22.2 mm, ext. Ø: 24.2 mm; collar Ø: 44 mm, height: 2/12/14 mm to provide insulation against stray current.

Sealingwasher (22.0/36.0/5.0)

PE-Hard foam LD29, black, to prevent any excess injection mortar HIT-RE on the anchor shaft.

Fixing plate (26.2/50.0/2.0)

To fix the rigid pad (HDPE) and elastic pad to the support assembling during concrete slab pouring.

Insert Body (Ø 28 mm)

Material: carbon steel (DIN/ISO 898/1), blue zinc plated: Fe/Zn 10B (DIN 50961), designed for an embedment of 120 mm

or**Bolt (M27, SW41)**

Material: 8.8 (DIN 931,EN ISO 4014), Blue Zinc Plated: Fe/Zn 10B (DIN 50961)
Head: Hexagonal

Spring washer (27.5/41.5/5.0)

Wire Grade: C7 (DIN 2076), blue zinc plated: Fe/Zn 10B (DIN 50961), deformation: 4mm

Washer (28.0/49.0/4.0)

Material: 4.8 (DIN 125), blue zinc plated: Fe/Zn 10B (DIN 50961)
Int. Ø= 28 mm, Ext. Ø= 49 mm

Collar Bush

Material: Plastic, int. Ø: 27.2 mm, ext. Ø: 30.5 mm; collar Ø: 49 mm, height: 2/12/14 mm to provide insulation against stray current.

Sealingwasher (27.0/36.0/5.0)

PE-Hard foam LD29, black, to prevent any excess injection mortar HIT-RE on the anchor shaft.

Fixing plate (31.2/55.0/2.0)

To fix the rigid pad (HDPE) and elastic pad to the support assembling during concrete slab pouring.

Insert Body (Ø 33 mm)

Material: carbon steel (DIN/ISO 898/1), blue zinc plated: Fe/Zn 10B (DIN 50961), designed for an embedment of 150 mm
